APPENDIX: Change Log	435

Introduction

When analyzing security incidents we always face the question which adversary we are possibly dealing with and what we know about their prior engagements and TTP, to get a better understanding of how to approach and what else to look for.

This document aims to create full profiles of all threat groups worldwide that have been identified with all research generously shared by anti-virus and security research organizations over the years. It can be used as “threat group cards”, as the document title suggests, to have everything together in an elaborate profile for each threat group. All dates shown in the cards are the dates when the stated activities started, not necessarily when the reports about them came out.

All information in this document comes from public sources (OSINT). The difficult part of attributing campaigns to actors has been done by those security research organizations as well. What makes this difficult is the fact that there may be some overlap between threat groups, where they share tools or people move between groups, or when groups suddenly change tactics or type of target.

Not all groups have been publicly documented as well as others; most groups have remained rather obscure and, of course, not all individual campaigns resulted in public knowledge – targeted companies usually don't welcome such exposure.

As a National CERT, ThaiCERT has a strictly neutral role and everything collected in this document does in no way signify specific endorsements, placing blame on countries or taking sides.

With that said, compiling this document has been a tremendously interesting journey into the dark world of cybercrime and the groups associated with it.

Approach

In order to obtain an initial set of actors, we perused the public archives from MISP, MITRE and the volunteer overview on Google Docs (resource 1-3 in the [APPENDIX: Sources Used](#)).

Generally, those, as well as media reports about threats, tend to lump everything together as aliases or synonyms – be it actual group names as tracked by research organizations, alleged (state) sponsor names, individual campaigns run by the group or specific pieces of malware used by the group. In this encyclopedia, aliases are only listed as such if we could realistically determine it to be a fact, generally because we found which organization gave it that name. Everything else known about each actor has been split off into the relevant fields (sponsors, operations, tools).

The next step was to search our Risk Intelligence archive and after that, using our favorite Internet search engine for any public news about each and every actor to find all their campaigns and other activities that have been discovered. Analysis of those (thousands of) reports created the total overview of all tools used and where this actor has been observed in terms of countries and sectors.

Lastly, we went over the entire rich archive known as Malpedia to augment the set with malware names that had not appeared in the reports we saw.

In each step we took great care to make sure only Open Source Intelligence appeared in this document.

Legal Notice

This encyclopedia has been developed to catalog all known important adversaries to information security, with the aim to get a better understanding of international threats and to aid in faster response to future incidents. The content is based on the public knowledge of the security community and not solely the view of ThaiCERT and ETDA. It may not necessarily represent state-of-the-art and it might be updated from time to time.

Third party sources are quoted as appropriate. ThaiCERT is not responsible for the content of the external sources, including external websites, nor their continued availability, referenced in this encyclopedia.

Where specific vendors or product names are given, those do not mean endorsement from ThaiCERT, but serve to document history only.

This encyclopedia is intended for educational and information purposes only. Neither ThaiCERT nor any person acting on its behalf is responsible for the use that might be made of the information contained in this encyclopedia. All information contained herein is provided on an "As Is" basis with no warranty whatsoever. ThaiCERT/ETDA does not promise any specific result, effects or outcome from the use of the information herein.

Acknowledgements

ThaiCERT express our sincere gratitude to the various CERT teams and security research organizations who peer-reviewed this document and provided valuable input and feedback. We are also very grateful for the security researchers who published so many and so detailed reports, as well as, indirectly, all the volunteers who contributed to the projects we could consult (listed in the [APPENDIX: Sources Used](#)).

Web Portal

All of the data in this book, as well as data on all tools listed as being used by the threat groups, will also become available from a brandnew Threat Group Cards web portal later this month.

MISP Users

MISP users can also obtain the data in MISP galaxy/cluster format from the Threat Group Cards web portal mentioned above, which can directly be imported in your system as described in the MISP manual.

Advanced Persistent Threat (APT) Groups

[Cybereason](#) provides the following definition of an Advanced Persistent Threat:

An advanced persistent threat is a stealthy cyberattack in which a person or group gains unauthorized access to a network and remains undetected for an extended period. The term's definition was traditionally associated with nation-state sponsorship, but over the last few years we've seen multiple examples of non-nation state groups conducting large-scale targeted intrusions for specific goals.

Apart from all the APT groups profiled in this chapter, there are of course others, but no public information is available about them. Especially CrowdStrike has been very active in researching APT groups and mentioned the following names in passing, in summary reports: Mercury, Boulder Bear, Magic Kitten, Big Panda, Dizzy Panda, Electric Panda, Eloquent Panda, Foxy Panda, Gibberish Panda, Impersonating Panda, Kryptonite Panda, Nomad Panda, Pale Panda, Poisonous Panda, Predator Panda, Radio Panda, Sabre Panda, Spicy Panda, Test Panda, Toxic Panda, Union Panda, Wet Panda, Corsair Jackal, Ghost Jackal, Viking Jackal, Clockwork Spider, Dextorous Spider, Magnetic Spider, Overlord Spider, Singing Spider and Union Spider.

Aggah

Names	Aggah (<i>Palo Alto</i>)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2018	
Description	<p>(<i>Palo Alto</i>) In March 2019, Unit 42 began looking into an attack campaign that appeared to be primarily focused on organizations within a Middle Eastern country. Further analysis revealed that this activity is likely part of a much larger campaign impacting not only that region but also the United States, and throughout Europe and Asia.</p> <p>Our analysis of the delivery document revealed it was built to load a malicious macro-enabled document from a remote server via Template Injection. These macros use BlogSpot posts to obtain a script that uses multiple Pastebin pastes to download additional scripts, which ultimately result in the final payload being RevengeRAT configured with a duckdns[.]org domain for C2. During our research, we found several related delivery documents that followed the same process to ultimately install RevengeRAT hosted on Pastebin, which suggests the actors used these TTPs throughout their attack campaign.</p> <p>Initially, we believed this activity to be potentially associated with the Gorgon Group. Our hypothesis was based on the high level TTPs including the use of RevengeRAT. However, Unit 42 has not yet identified direct overlaps with other high-fidelity Gorgon Group indicators. Based on this, we are not able to assign this activity to the Gorgon group with an appropriate level of certainty.</p> <p>In light of that, Unit 42 refers to the activity described in this blog as the Aggah Campaign based on the actor's alias "hagga", which was used to split data sent to the RevengeRAT C2 server and was the name of one of the Pastebin accounts used to host the RevengeRAT payloads.</p>	
Observed	<p>Sectors: Automotive, Education, Government, Healthcare, Hospitality, Manufacturing, Media, Retail and Technology.</p> <p>Countries: Austria, Bahrain, Brazil, Canada, China, Egypt, France, Germany, India, Ireland, Israel, Italy, Japan, Norway, Romania, Russia, Saudi Arabia, Spain, Sweden, UK, UAE and USA.</p>	
Tools used	Agent Tesla, Aggah, NanoCore RAT, njRAT and RevengeRAT.	
Operations performed	Dec 2018	Operation "Roma225" The Cybane-Yoroi ZLab researchers investigated a recent espionage malware implant weaponized to target companies in the Italian automotive sector. The malware was spread through well written phishing email trying to impersonate a senior partner of one of the major Brazilian business law firms: "Veirano Advogados". https://yoroi.company/research/the-enigmatic-roma225-campaign/
	Jun 2019	The Evolution of Aggah: From Roma225 to the RG Campaign https://yoroi.company/research/the-evolution-of-aggah-from-roma225-to-the-rg-campaign/
	Sep 2019	During our threat monitoring activities, we discovered an interesting drop chain related to the well-known Aggah campaign

		< https://yoroi.company/research/apt-or-not-apt-whats-behind-the-aggah-campaign/ >
	Jan 2020	Recently, during our Cyber Defence monitoring operations, we spotted other attack attempts directed to some Italian companies operating in the Retail sector. < https://yoroi.company/research/aggah-how-to-run-a-botnet-without-renting-a-server-for-more-than-a-year/ >
	Apr 2020	Upgraded Aggah malspam campaign delivers multiple RATs < https://blog.talosintelligence.com/2020/04/upgraded-aggah-malspam-campaign.html >
	May 2020	During our Cyber Threat Intelligence monitoring we spotted new malicious activities targeting some Italian companies operating worldwide in the manufacturing sector, some of them also part of the automotive production chain. < https://yoroi.company/research/cyber-criminal-espionage-operation-insists-on-italian-manufacturing/ >
	May 2020	In the past months since the Covid-19 outbreak, we have seen an enormous rise in mal-spam campaigns where hackers abuse the pandemic to try and claim victims. One such campaign that we spotted is a new variant of a unique malware loader named 'Aggah'. < https://www.deepinstinct.com/2020/05/25/aghast-at-aggah-teasing-security-controls-with-advanced-evasion-techniques/ >
Information		< https://unit42.paloaltonetworks.com/aggah-campaign-bit-ly-blogspot-and-pastebin-used-for-c2-in-large-scale-campaign/ >

Allanite

Names	Allanite (<i>Dragos</i>) Palmetto Fusion (<i>DHS</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2017
Description	<p>(<i>Dragos</i>) Allanite accesses business and industrial control (ICS) networks, conducts reconnaissance, and gathers intelligence in United States and United Kingdom electric utility sectors. Dragos assesses with moderate confidence that Allanite operators continue to maintain ICS network access to: (1) understand the operational environment necessary to develop disruptive capabilities, (2) have ready access from which to disrupt electric utilities.</p> <p>Allanite uses email phishing campaigns and compromised websites called watering holes to steal credentials and gain access to target networks, including collecting and distributing screenshots of industrial control systems. Allanite operations limit themselves to information gathering and have not demonstrated any disruptive or damaging capabilities.</p> <p>Allanite conducts malware-less operations primarily leveraging legitimate and available tools in the Windows operating system.</p>
Observed	Sectors: Energy. Countries: UK and USA.
Tools used	Inveigh, PsExec, SecreetsDump, THC Hydra and Powershell scripts.
Information	< https://dragos.com/resource/allanite/ >

Anchor Panda, APT 14

Names	Anchor Panda (<i>CrowdStrike</i>) APT 14 (<i>Mandiant</i>) Aluminum (<i>Microsoft</i>) QAZTeam
Country	China
Sponsor	State-sponsored, PLA Navy
Motivation	Information theft and espionage
First seen	2012
Description	<p>(<i>CrowdStrike</i>) Anchor Panda is an adversary that CrowdStrike has tracked extensively over the last year targeting both civilian and military maritime operations in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. In addition to maritime operations in this region, Anchor Panda also heavily targeted western companies in the US, Germany, Sweden, the UK, and Australia, and other countries involved in maritime satellite systems, aerospace companies, and defense contractors.</p> <p>Not surprisingly, embassies and diplomatic missions in the region, foreign intelligence services, and foreign governments with space programs were also targeted.</p>
Observed	Sectors: Aerospace, Defense, Engineering, Government, Industrial and NGOs in the green/brown water regions primarily in the area of operations of the South Sea Fleet of the PLA Navy. Countries: Australia, Germany, Sweden, UK, USA and others.
Tool used	Gh0st RAT, Poison Ivy and Torn RAT.
Information	< https://www.crowdstrike.com/blog/whois-anchor-panda/ >

APT 3, Gothic Panda, Buckeye

Names	APT 3 (<i>Mandiant</i>) Gothic Panda (<i>CrowdStrike</i>) Buckeye (<i>Symantec</i>) TG-0110 (<i>SecureWorks</i>) Bronze Mayfair (<i>SecureWorks</i>) UPS Team (<i>Symantec</i>) Group 6 (<i>Talos</i>)	
Country	China	
Sponsor	State-sponsored, Ministry of State Security and Internet security firm Guangzhou Bo Yu Information Technology Company Limited ("Boyusec")	
Motivation	Information theft and espionage	
First seen	2007	
Description	(Recorded Future) APT3 (also known as UPS, Gothic Panda, and TG-0110) is a sophisticated threat group that has been active since at least 2010. APT3 utilizes a broad range of tools and techniques including spear-phishing attacks, zero-day exploits, and numerous unique and publicly available remote access tools (RAT). Victims of APT3 intrusions include companies in the defense, telecommunications, transportation, and advanced technology sectors — as well as government departments and bureaus in Hong Kong, the U.S., and several other countries.	
Observed	Sectors: Aerospace, Construction, Defense, High-Tech, Manufacturing, Technology, Telecommunications and Transportation. Countries: Belgium, Hong Kong, Italy, Luxembourg, Philippines, Sweden, UK, USA and Vietnam.	
Tools used	APT3 Keylogger, Bemstour, DoublePulsar, EternalBlue, HTran, Hupigon, LaZagne, OSInfo, Pirpi, PlugX, RemoteCMD, shareip, TTCalc, w32times and several 0-days for IE, Firefox and Flash.	
Operations performed	2007	Hupigon and Pirpi Backdoors <https://www.fireeye.com/blog/threat-research/2010/11/ie-0-day-hupigon-joins-the-party.html>
	Apr 2014	Operation "Clandestine Fox" FireEye Research Labs identified a new Internet Explorer (IE) zero-day exploit used in targeted attacks. The vulnerability affects IE6 through IE11, but the attack is targeting IE9 through IE11. This zero-day bypasses both ASLR and DEP. Microsoft has assigned CVE-2014-1776 to the vulnerability and released security advisory to track this issue. <https://www.fireeye.com/blog/threat-research/2014/04/new-zero-day-exploit-targeting-internet-explorer-versions-9-through-11-identified-in-targeted-attacks.html>
	Jun 2014	Operation "Clandestine Fox", Part Deux While Microsoft quickly released a patch to help close the door on future compromises, we have now observed the threat actors behind "Operation Clandestine Fox" shifting their point of attack and using a new vector to target their victims: social networking. <https://www.fireeye.com/blog/threat-research/2014/06/clandestine-fox-part-deux.html>

	Nov 2014	Operation “Double Tap” This actor initiated their most recent campaign on November 19, 2014 targeting multiple organizations. The attacker leveraged multiple exploits, targeting both CVE-2014-6332 and CVE-2014-4113. <https://www.fireeye.com/blog/threat-research/2014/11/operation_doubletap.html>
	Jun 2015	Operation “Clandestine Wolf” In the last several weeks, APT3 actors launched a large-scale phishing campaign against organizations in the following industries: Aerospace and Defense, Construction and Engineering, High Tech, Telecommunications and Transportation. <https://www.fireeye.com/blog/threat-research/2015/06/operation-clandestine-wolf-adobe-flash-zero-day.html>
	Mar 2016	Variant of the DoublePulsar Backdoor Beginning in March 2016, Buckeye began using a variant of DoublePulsar (Backdoor.Doublepulsar), a backdoor that was subsequently released by the Shadow Brokers in 2017. DoublePulsar was delivered to victims using a custom exploit tool (Trojan.Bemstour) that was specifically designed to install DoublePulsar. <https://www.symantec.com/blogs/threat-intelligence/buckeye-windows-zero-day-exploit> <https://research.checkpoint.com/upsynergy/>
	Mar 2016	Buckeye cyberespionage group shifts gaze from US to Hong Kong <https://www.symantec.com/connect/blogs/buckeye-cyberespionage-group-shifts-gaze-us-hong-kong>
	Nov 2017	DOJ reveals indictment against Chinese cyber spies that stole U.S. business secrets <https://www.cyberscoop.com/boyusec-china-doj-indictment/>
	Nov 2017	U.S. Charges Three Chinese Hackers Who Work at Internet Security Firm for Hacking Three Corporations for Commercial Advantage <https://www.justice.gov/opa/pr/us-charges-three-chinese-hackers-who-work-internet-security-firm-hacking-three-corporations>

APT 4, Maverick Panda, Wisp Team

Names	APT 4 (<i>Mandiant</i>) APT 4 (<i>FireEye</i>) Maverick Panda (<i>CrowdStrike</i>) Wisp Team (<i>Symantec</i>) Sykipot (<i>AlienVault</i>)
Country	China
Sponsor	State-sponsored, PLA Navy
Motivation	Information theft and espionage
First seen	2007
Description	<p>(Trend Micro) Sykipot has a history of primarily targeting US Defense Initial Base (DIB) and key industries such as telecommunications, computer hardware, government contractors, and aerospace. Open source review of 15 major Sykipot attacks over the last 6 years confirm this.</p> <p>Recently, we encountered a case where Sykipot variants were gathering information related to the civil aviation sector. The exploitation occurred at a target consistent with their history, the information sought raises new interest. The intentions of this latest round of targeting are unclear, but it represents a change in shift in objectives or mission.</p>
Observed	Sectors: Aerospace, Aviation, Defense, Government and Telecommunications. Countries: USA.
Tools used	Sykipot and XMRig.
Operations performed	Dec 2011 Are the Sykipot's authors obsessed with next generation US drones? <https://cybersecurity.att.com/blogs/labs-research/are-the-sykipots-authors-obsessed-with-next-generation-us-drones>
	Jan 2012 Sykipot variant hijacks DOD and Windows smart cards <https://cybersecurity.att.com/blogs/labs-research/sykipot-variant-hijacks-dod-and-windows-smart-cards>
	Jul 2012 Sykipot is back <https://cybersecurity.att.com/blogs/labs-research/sykipot-is-back>
	Mar 2013 New Sykipot developments <https://cybersecurity.att.com/blogs/labs-research/new-sykipot-developments>
	Sep 2013 Sykipot Now Targeting US Civil Aviation Sector Information <https://blog.trendmicro.com/trendlabs-security-intelligence/sykipot-now-targeting-us-civil-aviation-sector-information/>
	2015 A group dubbed APT4 is suspected to be behind a breach of an Asian airline company discovered in the second quarter of this year. Its attack style uses well-written and researched 'spear-phishes' with industry themes. The attacks were aimed at public key infrastructure targets. <https://www.digitalnewsasia.com/digital-economy/asia-in-the-crosshairs-of-apt-attackers-fireeye-cto>

	Oct 2018	The report also mentions some attacks conducted by APT4 which includes sending malicious emails to a blockchain gaming start-up last year and attacking a cryptocurrency exchange in June 2018. In last October, the group also used XMRig, a Monero cryptocurrency mining tool in the target's computer. https://mycryptomag.com/2019/08/08/cryptocurrency-firms-are-targets-of-state-sponsored-hacking-group-from-china/

APT 5, Keyhole Panda

Names	APT 5 (FireEye) Keyhole Panda (CrowdStrike) TEMP.Bottle (iSight)	
Country	China	
Motivation	Information theft and espionage	
First seen	2007	
Description	<p>(FireEye) We have observed one APT group, which we call APT5, particularly focused on telecommunications and technology companies. More than half of the organizations we have observed being targeted or breached by APT5 operate in these sectors. Several times, APT5 has targeted organizations and personnel based in Southeast Asia.</p> <p>APT5 has been active since at least 2007. It appears to be a large threat group that consists of several subgroups, often with distinct tactics and infrastructure. APT5 has targeted or breached organizations across multiple industries, but its focus appears to be on telecommunications and technology companies, especially information about satellite communications.</p> <p>APT5 targeted the network of an electronics firm that sells products for both industrial and military applications. The group subsequently stole communications related to the firm's business relationship with a national military, including inventories and memoranda about specific products they provided.</p> <p>In one case in late 2014, APT5 breached the network of an international telecommunications company. The group used malware with keylogging capabilities to monitor the computer of an executive who manages the company's relationships with other telecommunications companies.</p> <p>There is some overlap with PittyTiger, Pitty Panda.</p>	
Observed	Sectors: Defense, High-Tech, Industrial, Technology and Telecommunications. Countries: Southeast Asia.	
Tools used	LEOUNCIA.	
Operations performed	Aug 2019	A group of Chinese state-sponsored hackers is targeting enterprise VPN servers from Fortinet and Pulse Secure after details about security flaws in both products became public knowledge last month. https://www.zdnet.com/article/a-chinese-apt-is-now-going-after-pulse-secure-and-fortinet-vpn-servers/

APT 6

Names	APT 6 (<i>FireEye</i>) 1.php Group (<i>Zscaler</i>)
Country	China
Motivation	Information theft and espionage
First seen	2011
Description	<p>(Kaspersky) The FBI issued a rare bulletin admitting that a group named Advanced Persistent Threat 6 (APT6) hacked into US government computer systems as far back as 2011 and for years stole sensitive data.</p> <p>The FBI alert was issued in February and went largely unnoticed. Nearly a month later, security experts are now shining a bright light on the alert and the mysterious group behind the attack.</p> <p>"This is a rare alert and a little late, but one that is welcomed by all security vendors as it offers a chance to mitigate their customers and also collaborate further in what appears to be an ongoing FBI investigation," said Deepen Desai, director of security research at the security firm Zscaler in an email to Threatpost.</p> <p>Details regarding the actual attack and what government systems were infected are scant. Government officials said they knew the initial attack occurred in 2011, but are unaware of who specifically is behind the attacks.</p> <p>"Given the nature of malware payload involved and the duration of this compromise being unnoticed – the scope of lateral movement inside the compromised network is very high possibly exposing all the critical systems," Deepen said.</p>
Observed	Sectors: Government. Countries: USA.
Tools used	Poison Ivy.

APT 12, Numbered Panda

Names	APT 12 (<i>Mandiant</i>) Numbered Panda (<i>CrowdStrike</i>) TG-2754 (<i>SecureWorks</i>) BeeBus (<i>FireEye</i>) Calc Team (<i>Symantec</i>) DynCALC (<i>Symantec</i>) DNSCalc (<i>Symantec</i>) Group 22 (<i>Talos</i>) Crimson Iron (<i>ThreatConnect</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2009	
Description	<p>(<i>CrowdStrike</i>) Numbered Panda has a long list of high-profile victims and is known by a number of names including: DYNCALC, IXESHE, JOY RAT, APT-12, etc. Numbered Panda has targeted a variety of victims including but not limited to media outlets, high-tech companies, and multiple governments. Numbered Panda has targeted organizations in time-sensitive operations such as the Fukushima Reactor Incident of 2011, likely filling intelligence gaps in the ground cleanup/mitigation operations. Screen saver files, which are binary executables and PDF documents, are common Numbered Panda weaponization tactics. One of the most interesting techniques that Numbered Panda likes to use is to dynamically calculate the Command and Control (C2) port by resolving a DNS. This effectively helps Numbered Panda bypass egress filtering implemented to prevent unauthorized communications on some enterprises. The malware will typically use two DNS names for communication: one is used for command and control; the other is used with an algorithm to calculate the port to communicate to.</p>	
Observed	<p>Sectors: Defense, Electronics, Government, High-Tech, Media, Telecommunications and journalists. Countries: Germany, USA and East Asia (mostly Japan and Taiwan).</p>	
Tools used	AUMLIB, ETUMBOT, IHEATE, IXESHE, RapidStealer, THREEBYTE and WaterSpout.	
Operations performed	Jul 2009	“IXESHE” campaign Target: East Asian governments, Taiwanese electronics manufacturers and a telecommunications company. < http://www.trendmicro.com/cloud-content/us/pdfs/security-intelligence/white-papers/wp_ixeshe.pdf >

APT 17, Deputy Dog, Elderwood, Sneaky Panda

Names	APT 17 (<i>Mandiant</i>) Tailgater Team (<i>Symantec</i>) Elderwood (<i>Symantec</i>) Elderwood Gang (<i>Symantec</i>) Sneaky Panda (<i>CrowdStrike</i>) SIG22 (<i>NSA</i>) Beijing Group (<i>SecureWorks</i>) TEMP.Avengers (<i>FireEye</i>) Dogfish (<i>iDefense</i>) Deputy Dog (<i>iDefense</i>) ATK 2 (<i>Thales</i>)
Country	China
Sponsor	State-sponsored, Jinan bureau of the Chinese Ministry of State Security
Motivation	Information theft and espionage
First seen	2009
Description	<p>(<i>Symantec</i>) In 2009, Google was attacked by a group using the Hydraq (Aurora) Trojan horse. Symantec has monitored this group's activities for the last three years as they have consistently targeted a number of industries. Interesting highlights in their method of operations include: the use of seemingly an unlimited number of zero-day exploits, attacks on supply chain manufacturers who service the target organization, and a shift to "watering hole" attacks (compromising certain websites likely to be visited by the target organization). The targeted industry sectors include, but are not restricted to; defense, various defense supply chain manufacturers, human rights and non-governmental organizations (NGOs), and IT service providers. These attackers are systematic and re-use components of an infrastructure we have termed the "Elderwood platform". The name "Elderwood" comes from a source code variable used by the attackers. This attack platform enables them to quickly deploy zero-day exploits. Attacks are deployed through spear phishing emails and also, increasingly, through Web injections in watering hole attacks.</p> <p>It is likely the attackers have gained access to the source code for some widely used applications, or have thoroughly reverse-engineered the compiled applications in order to discover these vulnerabilities. The vulnerabilities are used as needed, often within close succession of each other if exposure of any of the vulnerabilities is imminent. The scale of the attacks, in terms of the number of victims and the duration of the attacks, are another indication of the resources available to the attackers. Victims are attacked, not for petty crime or theft, but for the wholesale gathering of intelligence and intellectual property. The resources required to identify and acquire useful information—let alone analyze that information—could only be provided by a large criminal organization, attackers supported by a nation state, or a nation state itself.</p> <p>This group appears to be closely associated with Hidden Lynx, Aurora Panda and has infrastructure overlap with RedAlpha.</p> <p>Could also be related to Axiom, Group 72.</p>

APT 20, Violin Panda

Names	APT 20 (<i>FireEye</i>) APT 8 (<i>Mandiant</i>) Violin Panda (<i>CrowdStrike</i>) TH3Bug (<i>Palo Alto</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2014	
Description	<p>(<i>Palo Alto</i>) We've uncovered some new data and likely attribution regarding a series of APT watering hole attacks this past summer. Watering hole attacks are an increasingly popular component of APT campaigns, as many people are more aware of spear phishing and are less likely to open documents or click on links in unsolicited emails. Watering hole attacks offer a much better chance of success because they involve compromising legitimate websites and installing malware intended to compromise website visitors. These are often popular websites frequented by people who work in specific industries or have political sympathies to which the actors want to gain access.</p> <p>In contrast to many other APT campaigns, which tend to rely heavily on spear phishing to gain victims, "th3bug" is known for compromising legitimate websites their intended visitors are likely to frequent. Over the summer they compromised several sites, including a well-known Uyghur website written in that native language.</p> <p>This group could be related to Axiom, Group 72.</p>

APT 29, Cozy Bear, The Dukes

Names	APT 29 (<i>Mandiant</i>) Cozy Bear (<i>CrowdStrike</i>) The Dukes (<i>F-Secure</i>) Group 100 (<i>Talos</i>) Yttrium (<i>Microsoft</i>) Iron Hemlock (<i>SecureWorks</i>) Minidionis (<i>Palo Alto</i>) CloudLook (<i>Kaspersky</i>) ATK 7 (<i>Thales</i>) Grizzly Steppe (<i>US Government</i>) together with Sofacy, APT 28, Fancy Bear, Sednit
Country	Russia
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2008
Description	<p>(F-Secure) The Dukes are a well-resourced, highly dedicated and organized cyberespionage group that we believe has been working for the Russian Federation since at least 2008 to collect intelligence in support of foreign and security policy decision-making.</p> <p>The Dukes primarily target Western governments and related organizations, such as government ministries and agencies, political think tanks, and governmental subcontractors. Their targets have also included the governments of members of the Commonwealth of Independent States; Asian, African, and Middle Eastern governments; organizations associated with Chechen extremism; and Russian speakers engaged in the illicit trade of controlled substances and drugs.</p> <p>The Dukes are known to employ a vast arsenal of malware toolsets, which we identify as MiniDuke, CosmicDuke, OnionDuke, CozyDuke, CloudDuke, SeaDuke, HammerDuke, PinchDuke, and GeminiDuke. In recent years, the Dukes have engaged in apparently biannual large-scale spear-phishing campaigns against hundreds or even thousands of recipients associated with governmental institutions and affiliated organizations.</p> <p>These campaigns utilize a smash-and-grab approach involving a fast but noisy break-in followed by the rapid collection and exfiltration of as much data as possible. If the compromised target is discovered to be of value, the Dukes will quickly switch the toolset used and move to using stealthier tactics focused on persistent compromise and long-term intelligence gathering.</p> <p>In addition to these large-scale campaigns, the Dukes continuously and concurrently engage in smaller, much more targeted campaigns, utilizing different toolsets. These targeted campaigns have been going on for at least 7 years. The targets and timing of these campaigns appear to align with the known foreign and security policy interests of the Russian Federation at those times.</p>
Observed	Sectors: Defense, Energy, Government, Imagery, Law enforcement, Media, NGOs, Pharmaceutical, Telecommunications, Think Tanks and Transportation. 	Slovenia, Spain, South Korea, Turkey, Uganda, Ukraine, USA, Uzbekistan and NATO.
Tools used	ATI-Agent, AtNow, CloudDuke, Cobalt Strike, CosmicDuke, CozyDuke, FatDuke, GeminiDuke, HammerDuke, LiteDuke, meek, Mimikatz, MiniDuke, OnionDuke, PinchDuke, PolyglotDuke, POSHSPY, PowerDuke, RegDuke, SeaDuke, tDiscoverer and Living off the Land.
Operations performed	<p>Feb 2013 Since the original announcement, we have observed several new attacks using the same exploit (CVE-2013-0640) which drop other malware. Between these, we've observed a couple of incidents which are so unusual in many ways that we've decided to analyse them in depth. https://securelist.com/the-miniduke-mystery-pdf-0-day-government-spy-assembler-0x29a-micro-backdoor/31112/</p> <p>2013 While the old style Miniduke implants were used to target mostly government victims, the new style CosmicDuke implants have a somehow different typology of victims. The most unusual is the targeting of individuals that appear to be involved in the traffic and reselling of controlled and illegal substances, such as steroids and hormones. These victims in the NITRO project have been observed only in Russia. https://securelist.com/miniduke-is-back-nemesis-gemina-and-the-botgen-studio/64107/</p> <p>2013 Operation "Ghost" We call these newly uncovered Dukes campaigns, collectively, Operation Ghost, and describe how the group has been busy compromising government targets, including three European Ministries of Foreign Affairs and the Washington DC embassy of a European Union country, all without drawing attention to their activities. https://www.welivesecurity.com/wp-content/uploads/2019/10/ESET_Operation_Ghost_Dukes.pdf</p> <p>Mar 2014 Operation "Office monkeys" In March 2014, a Washington, D.C.-based private research institute was found to have CozyDuke (Trojan.Cozer) on their network. Cozy Bear then started an email campaign attempting to lure victims into clicking on a flash video of office monkeys that would also include malicious executables. By July the group had compromised government networks and directed CozyDuke-infected systems to install MiniDuke onto a compromised network. https://www.symantec.com/connect/blogs/forkmeiamfamous-seaduke-latest-weapon-duke-armory</p> <p>Aug 2015 Attack on the Pentagon in the USA In August 2015 Cozy Bear was linked to a spear-phishing cyberattack against the Pentagon email system causing the shutdown of the entire Joint Staff unclassified email system and Internet access during the investigation. https://www.cnbc.com/2015/08/06/russia-hacks-pentagon-computers-nbc-citing-sources.html</p> <p>Jun 2016 Breach of Democratic National Committee</p>

		<p>In June 2016, Cozy Bear was implicated alongside the hacker group Sofacy, APT 28, Fancy Bear, Sednit had only been there a few weeks. Cozy Bear's more sophisticated tradecraft and interest in traditional long-term espionage suggest that the group originates from a separate Russian intelligence agency.</p> <p><https://www.crowdstrike.com/blog/bears-midst-intrusion-democratic-national-committee/></p>
	Aug 2016	<p>Attacks on US think tanks and NGOs</p> <p>After the United States presidential election, 2016, Cozy Bear was linked to a series of coordinated and well-planned spear-phishing campaigns against U.S.-based think tanks and non-governmental organizations (NGOs).</p> <p><https://www.volatility.com/blog/2016/11/09/powerduke-post-election-spear-phishing-campaigns-targeting-think-tanks-and-ngos/></p>
	Jan 2017	<p>Attacks on the Norwegian Government</p> <p>On February 3, 2017, the Norwegian Police Security Service (PST) reported that attempts had been made to spear-phish the email accounts of nine individuals in the Ministry of Defense, Ministry of Foreign Affairs, and the Labour Party. The acts were attributed to Cozy Bear, whose targets included the Norwegian Radiation Protection Authority, PST section chief Arne Christian Haugstøyl, and an unnamed college.</p> <p><https://www.usatoday.com/story/news/2017/02/03/norway-russian-hackers-hit-spy-agency-defense-labour-party/97441782/></p>
	Feb 2017	<p>Attack on Dutch ministries</p> <p>In February 2017, the General Intelligence and Security Service (AIVD) of the Netherlands revealed that Fancy Bear and Cozy Bear had made several attempts to hack into Dutch ministries, including the Ministry of General Affairs, over the previous six months. Rob Bertholee, head of the AIVD, said on <i>EenVandaag</i> that the hackers were Russian and had tried to gain access to secret government documents.</p> <p><https://www.volkskrant.nl/cultuur-media/russen-faalden-bij-hackpogingen-ambtenaren-op-nederlandse-ministeries~b77ff391/></p>
	Nov 2018	<p>Phishing campaign in the USA</p> <p>Target: Multiple industries, including think tank, law enforcement, media, U.S. military, imagery, transportation, pharmaceutical, national government, and defense contracting.</p> <p>Method: Phishing email appearing to be from the U.S. Department of State with links to zip files containing malicious Windows shortcuts that delivered Cobalt Strike Beacon.</p> <p><https://www.fireeye.com/blog/threat-research/2018/11/not-so-cozy-an-uncomfortable-examination-of-a-suspected-apt29-phishing-campaign.html></p>

APT 30, Override Panda

Names	APT 30 (<i>Mandiant</i>) Override Panda (<i>CrowdStrike</i>)
Country	China
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2005
Description	<p>APT 30 is a threat group suspected to be associated with the Chinese government. While Naikon shares some characteristics with APT 30, the two groups do not appear to be exact matches.</p> <p>(FireEye) When our Singapore-based FireEye labs team examined malware aimed predominantly at entities in Southeast Asia and India, we suspected that we were peering into a regionally focused cyber espionage operation. The malware revealed a decade-long operation focused on targets—government and commercial—who hold key political, economic, and military information about the region. This group, who we call APT30, stands out not only for their sustained activity and regional focus, but also for their continued success despite maintaining relatively consistent tools, tactics, and infrastructure since at least 2005.</p> <p>Based on our knowledge of APT30's targeting activity and tools, their objective appears to be data theft as opposed to financial gain. APT30 has not been observed to target victims or data that can be readily monetized (for example, credit card data, personally identifiable information, or bank transfer credentials). Instead, their tools include functionality that allows them to identify and steal documents, including what appears to be an interest in documents that may be stored on air-gapped networks.</p> <p>The group expresses a distinct interest in organizations and governments associated with ASEAN, particularly so around the time of official ASEAN meetings.</p> <p>Many of APT30's decoy documents use topics related to Southeast Asia, India, border areas, and broader security and diplomatic issues. Decoy documents attached to spear phishing emails are frequently indicators of intended targeting because threat actors generally tailor these emails to entice their intended targets—who typically work on related issues—to click on the attachments and infect themselves.</p> <p>In addition to APT30's Southeast Asia and India focus, we've observed APT30 target journalists reporting on issues traditionally considered to be focal points for the Chinese Communist Party's sense of legitimacy, such as corruption, the economy, and human rights. In China, the Communist Party has the ultimate authority over the government. China-based threat groups have targeted journalists before; we believe they often do so to get a better understanding on developing stories to anticipate unfavorable coverage and better position themselves to shape public messaging.</p>

Operations performed	Apr 2014	Operation "PhantomLance" In July 2019, Dr. Web reported about a backdoor trojan in Google Play, which appeared to be sophisticated and unlike common malware often uploaded for stealing victims' money or displaying ads. So, we conducted an inquiry of our own, discovering a long-term campaign, which we dubbed "PhantomLance", its earliest registered domain dating back to December 2015. https://securelist.com/apt-phantomlance/96772/ https://labs.bitdefender.com/2020/05/android-campaign-from-known-oceanlotus-apt-group-potentially-older-than-estimated-abused-legitimate-certificate/
	Dec 2014	These applications disguise as a normal application, and their icons will hide automatically after they are running. They will release malicious sub-packages in the background, receive the remote control command, steal the privacy information of users such as SMS messages, contacts, call records, geographic locations, and browser records. They also download apks secretly and record audios and

		<p>videos, then upload users' privacy information to server, causing users' privacy leakage.</p> <p><https://www.antiy.net/p/analysis-of-the-attack-of-mobile-devices-by-oceanlotus/></p>
	Aug 2015	<p>Terracotta VPN</p> <p>Dubbed by RSA as "Terracotta VPN" (a reference to the Chinese Terracotta Army), this satellite array of VPN services "may represent the first exposure of a PRC-based VPN operation that maliciously, efficiently and rapidly enlists vulnerable servers around the world," the company said in a report released today.</p> <p><https://krebsonsecurity.com/2015/08/chinese-vpn-service-as-attack-platform/></p>
	Sep 2016	<p>Blackberry Cylance threat researchers have analyzed the Ratsnif 44rojans, which offer a veritable swiss-army knife of network attack techniques. The 44rojans, under active development since 2016, combine capabilities like packet sniffing, gateway/device ARP poisoning, DNS poisoning, HTTP injection, and MAC spoofing.</p> <p><https://threatvector.cylance.com/en_us/home/threat-spotlight-ratsnif-new-network-vermin-from-oceanlotus.html></p>
	Mar 2017	<p>Breach of the ASEAN website</p> <p>Steven Adair, founder and CEO, said the hacking group was still active, and had compromised the website of the Association of South East Asian Nations (ASEAN) over several high-profile summit meetings. ASEAN is holding another summit of regional leaders in the Philippines capital Manila this week.</p> <p><https://www.reuters.com/article/us-cyber-attack-vietnam/vietnams-neighbors-asean-targeted-by-hackers-report-idUSKBN1D70VU></p>
	May 2017	<p>Operation "Cobalt Kitty"</p> <p>Dubbed Operation Cobalt Kitty, the APT targeted a global corporation based in Asia with the goal of stealing proprietary business information. The threat actor targeted the company's top-level management by using spear-phishing attacks as the initial penetration vector, ultimately compromising the computers of vice presidents, senior directors and other key personnel in the operational departments. During Operation Cobalt Kitty, the attackers compromised more than 40 PCs and servers, including the domain controller, file servers, Web application server and database server.</p> <p><https://www.cybereason.com/blog/operation-cobalt-kitty-apt></p>
	May 2017	<p>Mass Digital Surveillance and Attacks Targeting ASEAN, Asian Nations, the Media, Human Rights Groups, and Civil Society</p> <p>In May 2017, Volexity identified and started tracking a very sophisticated and extremely widespread mass digital surveillance and attack campaign targeting several Asian nations, the ASEAN organization, and hundreds of individuals and organizations tied to media, human rights and civil society causes. These attacks are being conducted through numerous strategically compromised websites and have occurred over several high-profile ASEAN summits.</p> <p><https://www.volexity.com/blog/2017/11/06/oceanlotus-blossoms-mass-digital-surveillance-and-exploitation-of-asean-nations-the-media-human-rights-and-civil-society/></p>

	Oct 2017	During an incident response investigation in the final quarter of 2017, Cylance incident responders and threat researchers uncovered several bespoke backdoors deployed by OceanLotus Group (a.k.a. APT32, Cobalt Kitty), as well as evidence of the threat actor using obfuscated CobaltStrike Beacon payloads to perform C2. <https://threatvector.cylance.com/en_us/home/report-the-spyrats-of-oceanlotus.html>
	Early 2018	KerrDown downloader We identified two methods to deliver the KerrDown downloader to targets. One is using the Microsoft Office Document with a malicious macro and the other is RAR archive which contains a legitimate program with DLL side-loading. For RAR archive files, the file names used to trick targets are all in Vietnamese as shown in Figure 11. Our analysis shows that the primary targets of the ongoing campaign discussed in this blog are either in Vietnam or Vietnamese speaking individuals. <https://unit42.paloaltonetworks.com/tracking-oceanlotus-new-downloader-kerrdown/>
	Mar 2018	OceanLotus ships new backdoor using old tricks <https://www.welivesecurity.com/2018/03/13/oceanlotus-ships-new-backdoor/>
	Apr 2018	New MacOS Backdoor The MacOS backdoor was found in a malicious Word document presumably distributed via email. The document bears the filename “2018-PHIẾU GHI DANH THAM DỰ TỈNH HỘI HMDC 2018.doc,” which translates to “2018-REGISTRATION FORM OF HMDC ASSEMBLY 2018.doc.” The document claims to be a registration form for an event with HDMC, an organization in Vietnam that advertises national independence and democracy. <https://blog.trendmicro.com/trendlabs-security-intelligence/new-macos-backdoor-linked-to-oceanlotus-found/>
	Apr 2018	Steganography to Shroud Payloads The OceanLotus APT is using two new loaders which use steganography to read their encrypted payloads. <https://threatpost.com/oceanlotus-apt-uses-steganography-to-shroud-payloads/143373/>
	May 2018	Watering Hole Attack using the Phnom Penh Post website The attack started just days after Australian mining magnate Bill Clough sold the newspaper to Malaysian spin doctor Sivakumar Ganapathy, who specializes in “covert PR”. “Since last Tuesday [May 8], computers in our office were targeted by a malicious piece of code when we visited the Phnom Penh Post website,” said Naly Pilorge, director of Licadho — one of Cambodia’s leading human rights groups. <https://www.abc.net.au/news/2018-05-15/hackers-trigger-software-trap-after-phnom-penh-post-sale/9763906>
	Mid-2018	Equation Editor exploit In mid-2018, OceanLotus carried out a campaign using documents abusing the weakness exposed by the CVE-2017-11882 vulnerability. Indeed, several Proofs-of-Concept were made available. The

		vulnerability resides in the component responsible for rendering and editing mathematical equations. https://www.welivesecurity.com/2019/03/20/fake-or-fake-keeping-up-with-oceanlotus-decoys/
Sep 2018	Watering Hole Attack in Southeast Asia ESET researchers have discovered a new watering hole campaign targeting several websites in Southeast Asia, and that is believed to have been active since September 2018. This campaign stands out because of its large scale, as we were able to identify 21 compromised websites, some of which are particularly notable. Among the compromised websites were the Ministry of Defense of Cambodia, the Ministry of Foreign Affairs and International Cooperation of Cambodia and several Vietnamese newspaper or blog websites. https://www.welivesecurity.com/2018/11/20/oceanlotus-new-watering-hole-attack-southeast-asia/	
Jan 2019	Self-Extracting archives After using RTF files, the group started using self-extracting (SFX) archives that use common document icons in an attempt to further mislead their victims. It was briefly documented by Threatbook (in Chinese). When run, these self-extracting RAR files drop and execute DLL files (with a .ocx extension) with the final payload being the previously documented {A96B020F-0000-466F-A96D-A91BBF8EAC96}.dll. Since the middle of January 2019, OceanLotus began reusing the technique but changed some configuration over time.	
Mar 2019	macOS malware update Early in March 2019, a new macOS malware sample from the OceanLotus group was uploaded to VirusTotal, a popular online multi-scanner service. This backdoor executable bears the same features as the previous macOS variant we looked at, but its structure has changed and its detection was made harder. Unfortunately, we couldn't find the dropper associated with this sample so we do not know the initial compromise vector. https://www.welivesecurity.com/2019/04/09/oceanlotus-macos-malware-update/	
Mar 2019	Malicious macro armed documents likely targeting ASEAN affairs and meeting members. Telemetry and spreading statistics related to these decoy documents highlight their diffusion in the geographical area of Thailand. https://brica.de/alerts/alert/public/1258637/oceanlotus-on-asean-affairs/	
Mar 2019	Breach of Toyota in Australia, Japan, Thailand and Vietnam Toyota said the servers that hackers accessed stored sales information on up to 3.1 million customers. The carmaker said there's an ongoing investigation to find out if hackers exfiltrated any of the data they had access to. https://www.zdnet.com/article/toyota-announces-second-security-breach-in-the-last-five-weeks/	
May 2019	Attacks to Indochinese Peninsula	

		In this report, we share our summary of the latest attack techniques, attack payloads and related attacks of the OceanLotus, hoping that we can jointly improve understanding of OceanLotus group, an extremely active APT group. < https://ti.qianxin.com/blog/articles/oceanlotus-attacks-to-indochinese-peninsula-evolution-of-targets-techniques-and-procedure/ >

Motivation	Information theft and espionage, Sabotage and destruction	
First seen	2013	
Description	<p>(FireEye) When discussing suspected Middle Eastern hacker groups with destructive capabilities, many automatically think of the suspected Iranian group that previously used SHAMOON – aka Disttrack – to target organizations in the Persian Gulf. However, over the past few years, we have been tracking a separate, less widely known suspected Iranian group with potential destructive capabilities, whom we call APT33. Our analysis reveals that APT33 is a capable group that has carried out cyber espionage operations since at least 2013. We assess APT33 works at the behest of the Iranian government.</p> <p>APT33 has targeted organizations – spanning multiple industries – headquartered in the United States, Saudi Arabia and South Korea. APT33 has shown particular interest in organizations in the aviation sector involved in both military and commercial capacities, as well as organizations in the energy sector with ties to petrochemical production.</p> <p>APT 33 seems to be closely related to OilRig, APT 34, Helix Kitten since at least 2017.</p>	
Observed	<p>Sectors: Aviation, Defense, Education, Energy, Financial, Government, Healthcare, High-Tech, Manufacturing, Media, Petrochemical and others.</p> <p>Countries: Iran, Iraq, Israel, Saudi Arabia, South Korea, UK and USA.</p>

APT 41

Names	APT 41 (FireEye)	
Country	China	
Sponsor	State-sponsored	
Motivation	Financial crime, Information theft and espionage	
First seen	2012	
Description	<p>(FireEye) FireEye Threat Intelligence assesses with high confidence that APT41 is a prolific cyber threat group that carries out Chinese state-sponsored espionage activity in addition to financially motivated activity potentially outside of state control. Activity traces back to 2012 when individual members of APT41 conducted primarily financially motivated operations focused on the video game industry before expanding into likely state-sponsored activity. This is remarkable because explicit financially motivated targeting is unusual among Chinese state-sponsored threat groups, and evidence suggests these two motivations were balanced concurrently from 2014 onward.</p> <ul style="list-style-type: none">• APT41 Winnti Group, Blackfly, Wicked Panda. In some cases the primary observed similarity in the publicly reported Winnti activity was the use of the same malware – including HIGHNOON – across otherwise separate clusters of activity.• Previous FireEye Threat Intelligence reporting on the use of HIGHNOON and related activity was grouped together under both Ke3chang, Vixen Panda, APT 15, GREF, Playful Dragon.• and Mana, although we now understand this to be the work of several Chinese cyber espionage groups that share tools and digital certificates.• APT41 reflects our current understanding of what was previously reported as GREF, as well as additional indicators and activity gathered during our extensive review of our intelligence holdings.	
Observed	<p>Sectors: Construction, Defense, Education, Energy, Financial, Government, Healthcare, High-Tech, Hospitality, Manufacturing, Media, Oil and gas, Petrochemical, Pharmaceutical, Retail, Telecommunications, Transportation and Online video game companies.</p> <p>Countries: Australia, Canada, Denmark, Finland, France, Hong Kong, India, Italy, Japan, Malaysia, Mexico, Myanmar, Netherlands, Philippines, Poland, Qatar, Saudi Arabia, Singapore, South Korea, South Africa, Sweden, Switzerland, Thailand, Turkey, UAE, UK and USA.</p>

Operations performed	Autumn 2016	Breach of TeamViewer < https://www.bleepingcomputer.com/news/security/teamviewer-confirms-undisclosed-breach-from-2016/ >

	Jul 2017	ShadowPad is one of the largest known supply-chain attacks. Had it not been detected and patched so quickly, it could potentially have targeted hundreds of organizations worldwide. <https://www.kaspersky.com/about/press-releases/2017_shadowpad-how-attackers-hide-backdoor-in-software-used-by-hundreds-of-large-companies-around-the-world>
	Jun 2018	Operation “ShadowHammer” A supply-chain attack dubbed “Operation ShadowHammer” has been uncovered, targeting users of the ASUS Live Update Utility with a backdoor injection. The China-backed BARIUM APT is suspected to be at the helm of the project. According to Kaspersky Lab, the campaign ran from June to at least November 2018 and may have impacted more than a million users worldwide – though the adversaries appear to have been after specific victims in Asia. <https://threatpost.com/asus-pc-backdoors-shadowhammer/143129/>
	Mar 2019	Although the malware uses different configurations in each case, the three affected software products included the same backdoor code and were launched using the same mechanism. While two of the compromised products no longer include the backdoor, one of the affected developers is still distributing the trojanized version: ironically, the game is named Infestation, and is produced by Thai developer Electronics Extreme. <https://www.welivesecurity.com/2019/03/11/gaming-industry-scope-attackers-asia/>
	Apr 2019	In April 2019, FireEye’s Managed Defense team identified suspicious activity on a publicly-accessible web server at a U.S.-based research university. This activity, indicated that the attackers were exploiting CVE-2019-3396, a vulnerability in Atlassian Confluence Server that allowed for path traversal and remote code execution. <https://www.fireeye.com/blog/threat-research/2019/08/game-over-detecting-and-stopping-an-apt41-operation.html>
	Aug 2019	APT41’s newest espionage tool, MESSAGE TAP, was discovered during a 2019 investigation at a telecommunications network provider within a cluster of Linux servers. Specifically, these Linux servers operated as Short Message Service Center (SMSC) servers. <https://www.fireeye.com/blog/threat-research/2019/10/messagetap-who-is-reading-your-text-messages.html>
	Oct 2019	Winnti Group’s skip-2.0: A Microsoft SQL Server backdoor <https://www.welivesecurity.com/2019/10/21/winnti-group-skip2-0-microsoft-sql-server-backdoor/>
	Nov 2019	In November 2019, we discovered a new campaign run by the Winnti Group against two Hong Kong universities. We found a new variant of the ShadowPad backdoor, the group’s flagship backdoor, deployed using a new launcher and embedding numerous modules. The Winnti malware was also found at these universities a few weeks prior to ShadowPad. <https://www.welivesecurity.com/2020/01/31/winnti-group-targeting-universities-hong-kong/>

	Jan 2020	Between January 20 and March 11, FireEye observed APT41 attempt to exploit vulnerabilities in Citrix NetScaler/ADC, Cisco routers, and Zoho ManageEngine Desktop Central at over 75 FireEye customers. < https://www.fireeye.com/blog/threat-research/2020/03/apt41-initiates-global-intrusion-campaign-using-multiple-exploits.html > < https://unit42.paloaltonetworks.com/apt41-using-new-speculoos-backdoor-to-target-organizations-globally/ >
	Feb 2020	In February 2020, we discovered a new, modular backdoor, which we named PipeMon. Persisting as a Print Processor, it was used by the Winnti Group against several video gaming companies that are based in South Korea and Taiwan and develop MMO (Massively Multiplayer Online) games. Video games developed by these companies are available on popular gaming platforms and have thousands of simultaneous players. < https://www.welivesecurity.com/2020/05/21/no-game-over-winnti-group/ >

AVIVORE

Names	AVIVORE (<i>Context</i>)
Country	China
Motivation	Information theft and espionage
First seen	2015
Description	<p>(<i>Context</i>) Until now, most prominent supply chain intrusions have been "vertical"; initial victims are typically Managed Services Providers or software vendors leveraged by attackers to move up or down the supply chain. However, since summer 2018, Context Information Security has been investigating a series of incidents targeting UK and European Aerospace and Defence that are best described as "horizontal". Advanced attackers have been leveraging direct connectivity between suppliers and partners who are integrated into each other's value chains. We have been tracking this activity under the codename AVIVORE.</p> <p>Affected victims include large multinational firms (Primes) and smaller engineering or consultancy firms within their supply chain (Secondaries). Context has worked closely with victims, the National Cyber Security Centre (NCSC), security organisations, and law enforcement agencies across Europe to reduce impact and prevent further compromise.</p>
Observed	Sectors: Aerospace, Automotive, Energy and Satellites. Countries: UK and Europe.
Tools used	Mimikatz, PlugX and Living off the Land.

Axiom, Group 72

Names	Axiom (<i>Novetta</i>) Group 72 (<i>Talos</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2008	
Description	<p>(<i>Talos</i>) Group 72 is a long standing threat actor group involved in Operation SMN, named Axiom by Novetta. The group is sophisticated, well funded, and possesses an established, defined software development methodology. The group targets high profile organizations with high value intellectual property in the manufacturing, industrial, aerospace, defense, media sectors. Geographically, the group almost exclusively targets organizations based in United States, Japan, Taiwan, and Korea. The preferred tactics of the group include watering-hole attacks, spear-phishing, and other web-based tactics.</p> <p>The tools and infrastructure used by the attackers are common to a number of other threat actor groups which may indicate some degree of overlap. We have seen similar patterns used in domain registration for malicious domains, and the same tactics used in other threat actor groups leading us to believe that this group may be part of a larger organization that comprises many separate teams, or that different groups share tactics, code and personnel from time to time.</p> <p>Though both this group and Winnti Group, Blackfly, Wicked Panda use the malware Winnti, the two groups appear to be distinct based on differences in reporting on the groups' TTPs and targeting.</p> <p>Could be related to APT 17, Deputy Dog, Elderwood, Sneaky Panda and/or APT 20, Violin Panda.</p>	
Observed	<p>Sectors: High profile organizations with high value intellectual property in Aerospace, Defense, Industrial, Manufacturing and Media.</p> <p>Countries: Japan, South Korea, Taiwan and USA.</p>	
Tools used	9002 RAT, DeputyDog, Derusbi, Gh0st RAT, HiKit, PlugX, Poison Ivy, Winnti, ZoxPNG, ZoxRPC and ZXShell.	
Operations performed	2008-2014	Operation "SMN" Axiom is responsible for directing highly sophisticated cyberespionage against numerous Fortune 500 companies, journalists, environmental groups, pro-democracy groups, software companies, academic institutions and government agencies worldwide for at least the last six years. In our coordinated effort, we performed the first ever-private sponsored interdiction against a sophisticated state sponsored advanced threat group. Our efforts detected and cleaned 43,000 separate installations of Axiom tools, including 180 of their top tier implants. <http://www.novetta.com/wp-content/uploads/2014/11/Executive_Summary-Final_1.pdf>

MITRE ATT&CK

<<https://attack.mitre.org/groups/G0001/>>

Bahamut

Names	Bahamut (<i>Bellingcat</i>)		
Country	[Middle East]		
Motivation	Information theft and espionage		
First seen	2016		
Description	<p>(Bellingcat) Bahamut was first noticed when it targeted a Middle Eastern human rights activist in the first week of January 2017. Later that month, the same tactics and patterns were seen in attempts against an Iranian women's activist – an individual commonly targeted by Iranian actors, such as Magic Hound, APT 35, Cobalt Gypsy, Charming Kitten and the Sima campaign documented in our 2016 Black Hat talk. Recurrent patterns in hostnames, registrations, and phishing scripts provided a strong link between the two incidents, and older attempts were found that directly overlapped with these attacks. Over the course of the following months, several more attempts against the same individuals were observed, intended to steal credentials for iCloud and Gmail accounts.</p> <p>Bahamut was also observed engaging in reconnaissance and counter-reconnaissance attempts, intended to harvest IP addresses of emails accounts. One attempt impersonated BBC News Alerts, using timely content related to the diplomatic conflict between Qatar and other Gulf states as bait. This message used external images embedded in the email to track where the lure would be opened.</p>		
Observed	<p>Sectors: Political, economic and social. Countries: Egypt, Iran, Palestine, Qatar, Tunisia, Turkey and UAE.</p>		
Tools used	Bahamut and DownPaper.		
Operations performed	Dec 2016	<p>Beginning in December 2016, unconnected Middle Eastern human rights activists began to receive spear-phishing messages in English and Persian that were not related to any previously-known groups. These attempts differed from other tactics seen by us elsewhere, such as those connected to Iran, with better attention paid to the operation of the campaign.</p> <p><https://www.bellingcat.com/news/mena/2017/06/12/bahamut-pursuing-cyber-espionage-actor-middle-east/></p>	
	Oct 2017	<p>For three months there was no apparent further activity from the actor. However, in the same week of September a series of spear-phishing attempts once again targeted a set of otherwise unrelated individuals, employing the same tactics as before. Bahamut remains active, and its operations are more extensive than first disclosed.</p> <p><https://www.bellingcat.com/resources/case-studies/2017/10/27/bahamut-revisited-cyber-espionage-middle-east-south-asia/></p>	
	Jun 2018	<p>Cisco Talos has identified a highly targeted campaign against 13 iPhones which appears to be focused on India. The attacker deployed an open-source mobile device management (MDM) system to control enrolled devices.</p> <p><https://blog.talosintelligence.com/2018/07/Mobile-Malware-Campaign-uses-Malicious-MDM.html></p>	
	Jul 2018	<p>The Bahamut group was discovered and detailed by Bellingcat, an open-source news website. In this post, the author was discussing</p>	

	<p>Android-based malware with some similarities to the iOS malware we identified. That post kickstarted our investigation into any potential overlap between these campaigns and how they are potentially linked. The new MDM platform we identified has similar victimology with Middle Eastern targets, namely Qatar, using a U.K. mobile number issued from Lycamobile. Bahamut targeted similar Qatar-based individuals during their campaign.</p> <p><https://blog.talosintelligence.com/2018/07/Mobile-Malware-Campaign-uses-Malicious-MDM-Part2.html></p>

Barium

Names	Barium (<i>Microsoft</i>) Pigfish (<i>iDefense</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2016	
Description	<p>(Microsoft) Barium begins its attacks by cultivating relationships with potential victims—particularly those working in Business Development or Human Resources—on various social media platforms. Once Barium has established rapport, they spear-phish the victim using a variety of unsophisticated malware installation vectors, including malicious shortcut (.lnk) files with hidden payloads, compiled HTML help (.chm) files, or Microsoft Office documents containing macros or exploits. Initial intrusion stages feature the Win32/Barlaiy implant—notable for its use of social network profiles, collaborative document editing sites, and blogs for C&C. Later stages of the intrusions rely upon Winnti for persistent access. The majority of victims recorded to date have been in electronic gaming, multimedia, and Internet content industries, although occasional intrusions against technology companies have occurred.</p> <p>Also see APT 41, which overlaps with Barium.</p>	
Observed	Sectors: Media, Online video game companies and Technology.	
Tools used	Barlaiy, Cobalt Strike, PlugX and Winnti.	
Counter operations	Nov 2017	Microsoft Asks Judge to Take Down Barium Hackers < https://www.courthousenews.com/wp-content/uploads/2017/11/barium.pdf >

Berserk Bear, Dragonfly 2.0

Names	Berserk Bear (<i>CrowdStrike</i>) Dragonfly 2.0 (<i>Symantec</i>) Dymalloy (<i>Dragos</i>)	
Country	Russia	
Motivation	Sabotage and destruction	
First seen	2010	
Description	Dragonfly 2.0 is a suspected Russian group that has targeted government entities and multiple U.S. critical infrastructure sectors since at least March 2016. There is debate over the extent of overlap between Dragonfly 2.0 and Energetic Bear , Dragonfly , but there is sufficient evidence to lead to these being tracked as two separate groups.	
Observed	Sectors: Energy. Countries: Azerbaijan, Belgium, Canada, France, Germany, Italy, Norway, Russia, Singapore, Spain, Switzerland, Turkey, UK, Ukraine and USA.	
Tools used	Goodor, Impacket, Karagany, Phishery and Living off the Land.	
Operations performed	Dec 2015	Symantec has evidence indicating that the Dragonfly 2.0 campaign has been underway since at least December 2015 and has identified a distinct increase in activity in 2017. <https://www.symantec.com/blogs/threat-intelligence/dragonfly-energy-sector-cyber-attacks>
	May 2017	Attack on nuclear facilities in the US Since May, hackers have been penetrating the computer networks of companies that operate nuclear power stations and other energy facilities, as well as manufacturing plants in the United States and other countries. Among the companies targeted was the Wolf Creek Nuclear Operating Corporation, which runs a nuclear power plant near Burlington, Kan., according to security consultants and an urgent joint report issued by the Department of Homeland Security and the Federal Bureau of Investigation last week. <https://www.nytimes.com/2017/07/06/technology/nuclear-plant-hack-report.html> http://fortune.com/2017/09/06/hack-energy-grid-symantec/
	May 2017	Attacks on critical infrastructure and energy companies around the world Since at least May 2017, Talos has observed attackers targeting critical infrastructure and energy companies around the world, primarily in Europe and the United States. These attacks target both the critical infrastructure providers, and the vendors those providers use to deliver critical services. Attacks on critical infrastructure are not a new concern for security researchers, as adversaries are keen to understand critical infrastructure ICS networks for reasons unknown, but surely nefarious. <https://blog.talisintelligence.com/2017/07/template-injection.html> <https://www.us-cert.gov/ncas/alerts/TA18-074A>

The Big Bang

Names	The Big Bang (<i>Check Point</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2017
Description	<p>(Talos) Talos continuously monitors malicious emails campaigns. We identified one specific spear phishing campaign launched against targets within Palestine, and specifically against Palestinian law enforcement agencies. This campaign started in April 2017, using a spear phishing campaign to deliver the MICROPSIA payload in order to remotely control infected systems. Although this technique is not new, it remains an effective technique for attackers.</p> <p>The malware itself was developed in Delphi; in this article, we describe the features and the network communication to the command and control server used by the attackers. The threat actor has chosen to reference TV show characters and include German language words within the attack. Most significantly, the attacker has appeared to have used genuine documents stolen from Palestinian sources as well as a controversial music video as part of the attack.</p> <p>(Check Point) While the APT has gone through significant upgrades over the past year, the conductors of these campaigns maintained evident fingerprints, both in the delivery methods and malware development conventions. These unique traces assisted us in correlating the current wave to past attacks, and may also have some resemblance to attacks related to the Molerats, Extreme Jackal, Gaza Cybergang APT group.</p>
Observed	Sectors: Law enforcement and others. Countries: Middle East and Palestine.
Tools used	Micropsia.
Information	< https://blog.talosintelligence.com/2017/06/palestine-delphi.html > < https://research.checkpoint.com/2018/apt-attack-middle-east-big-bang/ >

Bitter

Names	Bitter (<i>Forcepoint</i>) T-APT-17 (<i>Tencent</i>)	
Country	[South Asia]	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(Forcepoint) Forcepoint Security Labs recently encountered a strain of attacks that appear to target Pakistani nationals. We named the attack “BITTER” based on the network communication header used by the latest variant of remote access tool (RAT) used.</p> <p>Our investigation indicates that the campaign has existed since at least November 2013 but has remained active until today.</p>	
Observed	<p>Sectors: Energy, Engineering and Government. Countries: China, Pakistan and Saudi Arabia.</p>	
Tools used	ArtraDownloader and BitterRAT.	
Operations performed	Nov 2013	<p>Spear-phishing emails are used to target prospective BITTER victims. The campaign predominantly used the older, relatively popular Microsoft Office exploit, CVE-2012-0158, in order to download and execute a RAT binary from a website.</p> <p><https://www.forcepoint.com/blog/x-labs/bitter-targeted-attack-against-pakistan></p>
	Jun 2016	<p>Recently, 360 Threat Intelligence Center found a series of targeted attacks against Pakistan targets. Attacker exploited one vulnerability (CVE-2017-12824) of InPage to craft bait documents (.inp).</p> <p><https://ti.360.net/blog/articles/analysis-of-targeted-attack-against-pakistan-by-exploiting-inpage-vulnerability-and-related-apt-groups-english></p>
	Sep 2018	<p>Starting in September 2018 and continuing through the beginning of 2019, BITTER launched a wave of attacks targeting Pakistan and Saudi Arabia. This is the first reported instance of BITTER targeting Saudi Arabia. Details surrounding these attacks and the three ArtraDownloader variants observed are described below.</p> <p><https://unit42.paloaltonetworks.com/multiple-artradownloader-variants-used-by-bitter-to-target-pakistan></p>
	May 2019	<p>The Anomali Threat Research Team discovered a phishing site impersonating a login page for the Ministry of Foreign Affairs of the People’s Republic of China email service. When visitors attempt to login to the fraudulent page, they are presented with a pop-up verification message asking users to close their windows and continue browsing.</p> <p><https://www.anomali.com/blog/suspected-bitter-apt-continues-targeting-government-of-china-and-chinese-organizations#When:19:24:00Z></p>
Information	< https://unit42.paloaltonetworks.com/multiple-artradownloader-variants-used-by-bitter-to-target-pakistan >	

Blackgear

Names	Blackgear (<i>Trend Micro</i>) Topgear	
Country	China	
Motivation	Information theft and espionage	
First seen	2018	
Description	<p>(<i>Trend Micro</i>) Blackgear is an espionage campaign which has targeted users in Taiwan for many years. Multiple papers and talks have been released covering this campaign, which used the ELIRKS backdoor when it was first discovered in 2012. It is known for using blogs and microblogging services to hide the location of its actual command-and-control (C&C) servers. This allows an attacker to change the C&C server used quickly by changing the information in these posts.</p> <p>Like most campaigns, Blackgear has evolved over time. Our research indicates that it has started targeting Japanese users. Two things led us to this conclusion: first, the fake documents that are used as part of its infection routines are now in Japanese. Secondly, it is now using blogging sites and microblogging services based in Japan for its C&C activity.</p>	
Observed	Countries: Japan, South Korea and Taiwan.	
Tools used	Comnie, Elirks and Protux.	
Operations performed	Jul 2018	Resurfaces, Abuses Social Media for C&C Communication https://blog.trendmicro.com/trendlabs-security-intelligence/blackgear-cyberespionage-campaign-resurfaces-abuses-social-media-for-cc-communication/
Information	https://blog.trendmicro.com/trendlabs-security-intelligence/blackgear-espionage-campaign-evolves-adds-japan-target-list/	

BlackOasis

Names	BlackOasis (<i>Kaspersky</i>)		
Country	[Middle East]		
Motivation	Information theft and espionage		
First seen	2015		
Description	BlackOasis is a Middle Eastern threat group that is believed to be a customer of Gamma Group. The group has shown interest in prominent figures in the United Nations, as well as opposition bloggers, activists, regional news correspondents, and think tanks. A group known by Microsoft as Neodymium is reportedly associated closely with BlackOasis operations, but evidence that the group names are aliases has not been identified.		
Observed	Sectors: Media, Think Tanks, activists and the UN. Countries: Afghanistan, Angola, Bahrain, Iran, Iraq, Jordan, Libya, Netherlands, Nigeria, Russia, Saudi Arabia, Tunisia and UK.		
Tools used	FinFisher, Wingbird and 0-day vulnerabilities in Flash.		
Operations performed	Jun 2015	Leveraging data from Kaspersky Security Network, we identified two other similar exploit chains used by BlackOasis in June 2015 which were zero days at the time. Those include CVE-2015-5119 and CVE-2016-0984, which were patched in July 2015 and February 2016 respectively. These exploit chains also delivered FinSpy installation packages. https://securelist.com/blackoasis-apt-and-new-targeted-attacks-leveraging-zero-day-exploit/82732/	
	May 2016	We first became aware of BlackOasis' activities in May 2016, while investigating another Adobe Flash zero day. On May 10, 2016, Adobe warned of a vulnerability (CVE-2016-4117) affecting Flash Player 21.0.0.226 and earlier versions for Windows, Macintosh, Linux, and Chrome OS. The vulnerability was actively being exploited in the wild.	
	Sep 2017	FireEye recently detected a malicious Microsoft Office RTF document that leveraged CVE-2017-8759, a SOAP WSDL parser code injection vulnerability. This vulnerability allows a malicious actor to inject arbitrary code during the parsing of SOAP WSDL definition contents. https://www.fireeye.com/blog/threat-research/2017/09/zero-day-used-to-distribute-finspy.html	
	Oct 2017	On October 10, 2017, Kaspersky Lab's advanced exploit prevention systems identified a new Adobe Flash zero day exploit used in the wild against our customers. The exploit was delivered through a Microsoft Office document and the final payload was the latest version of FinSpy malware. https://securelist.com/blackoasis-apt-and-new-targeted-attacks-leveraging-zero-day-exploit/82732/	
MITRE ATT&CK	https://attack.mitre.org/groups/G0063/		

BlackTech, Circuit Panda, Radio Panda

Names	BlackTech (<i>Trend Micro</i>) Circuit Panda (<i>CrowdStrike</i>) Radio Panda (<i>CrowdStrike</i>) T-APT-03 (<i>Tencent</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(<i>Trend Micro</i>) BlackTech is a cyber espionage group operating against targets in East Asia, particularly Taiwan, and occasionally, Japan and Hong Kong. Based on the mutexes and domain names of some of their C&C servers, BlackTech's campaigns are likely designed to steal their target's technology.</p> <p>Following their activities and evolving tactics and techniques helped us uncover the proverbial red string of fate that connected three seemingly disparate campaigns: PLEAD, Shrouded Crossbow, and of late, Waterbear.</p>	
Observed	Sectors: Financial, Government, Healthcare and Technology. Countries: Hong Kong, Japan and Taiwan.	
Tools used	BIFROST, Bluether, DRIGO, IconDown, KIVARS, PLEAD and XBOW.	
Operations performed	2010	Operation "Shrouded Crossbow" This campaign, first observed in 2010, is believed to be operated by a well-funded group given how it appeared to have purchased the source code of the BIFROST backdoor, which the operators enhanced and created other tools from. Shrouded Crossbow targeted privatized agencies and government contractors as well as enterprises in the consumer electronics, computer, healthcare, and financial industries. https://blog.trendmicro.com/trendlabs-security-intelligence/following-trail-blacktech-cyber-espionage-campaigns/
	2012	Operation "PLEAD" PLEAD is an information theft campaign with a penchant for confidential documents. Active since 2012, it has so far targeted Taiwanese government agencies and private organizations.
	2014	Operation "Waterbear" Waterbear has actually been operating for a long time. The campaign's name is based on its malware's capability to equip additional functions remotely.
	Jul 2018	ESET researchers have discovered a new malware campaign misusing stolen digital certificates. We spotted this malware campaign when our systems marked several files as suspicious. Interestingly, the flagged files were digitally signed using a valid D-Link Corporation code-signing certificate. The exact same certificate had been used to sign non-malicious D-Link software; therefore, the certificate was likely stolen. https://www.welivesecurity.com/2018/07/09/certificates-stolen-taiwanese-tech-companies-plead-malware-campaign/
	Apr 2019	At the end of April 2019, ESET researchers utilizing ESET telemetry observed multiple attempts to deploy Plead malware in an unusual

		<p>way. Specifically, the Plead backdoor was created and executed by a legitimate process named AsusWSPanel.exe. This process belongs to the Windows client for a cloud storage service called ASUS WebStorage.</p> <p><https://www.welivesecurity.com/2019/05/14/plead-malware-mitm-asus-webstorage/></p>
	Dec 2019	<p>[...] in one of its recent campaigns, we've discovered a piece of Waterbear payload with a brand-new purpose: hiding its network behaviors from a specific security product by API hooking techniques. In our analysis, we have discovered that the security vendor is APAC-based, which is consistent with BlackTech's targeted countries.</p> <p><https://blog.trendmicro.com/trendlabs-security-intelligence/waterbear-is-back-uses-api-hooking-to-e evade-security-product-detection/></p>
Information	<p><https://blog.trendmicro.com/trendlabs-security-intelligence/following-trail-blacktech-cyber-espionage-campaigns/></p>	

Blind Eagle

Names	Blind Eagle (Qihoo 360) APT-C-36 (Qihoo 360)
Country	[Latin America]
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2018
Description	<p>(Qihoo 360) Since April 2018, an APT group (Blind Eagle, APT-C-36) suspected coming from South America carried out continuous targeted attacks against Colombian government institutions as well as important corporations in financial sector, petroleum industry, professional manufacturing, etc.</p> <p>Till this moment, 360 Threat Intelligence Center captured 29 bait documents, 62 Trojan samples and multiple related malicious domains in total. Attackers are targeting Windows platform and aiming at government institutions as well as big companies in Colombia.</p>
Observed	Sectors: Financial, Government and large domestic companies and multinational corporation branches. Countries: Colombia.
Tools used	Imminent Monitor RAT and LimeRAT.
Information	< https://ti.360.net/blog/articles/apt-c-36-continuous-attacks-targeting-colombian-government-institutions-and-corporations-en/ >

Blue Termite, Cloudy Omega

Names	Blue Termite (<i>Kaspersky</i>) Cloudy Omega (<i>Symantec</i>)
Country	China
Motivation	Information theft and espionage
First seen	2013
Description	<p>(Kaspersky) In October 2014, Kaspersky Lab started to research “Blue Termite”, an Advanced Persistent Threat (APT) targeting Japan. The oldest sample we’ve seen up to now is from November 2013.</p> <p>This is not the first time the country has been a victim of an APT. However, the attack is different in two respects: unlike other APTs, the main focus of Blue Termite is to attack Japanese organizations; and most of their C2s are located in Japan. One of the top targets is the Japan Pension Service, but the list of targeted industries includes government and government agencies, local governments, public interest groups, universities, banks, financial services, energy, communication, heavy industry, chemical, automotive, electrical, news media, information services sector, health care, real estate, food, semiconductor, robotics, construction, insurance, transportation and so on. Unfortunately, the attack is still active and the number of victims has been increasing.</p>
Observed	Sectors: Automotive, Chemical, Construction, Education, Energy, Financial, Food and Agriculture, Government, Healthcare, High-Tech, Industrial, IT, Media, Real estate, Telecommunications, Transportation and several others. Countries: Japan.
Tools used	Emdivi and 0-days from the Hacking Team breach.
Information	< https://securelist.com/new-activity-of-the-blue-termite-apt/71876/ > < https://www.symantec.com/connect/blogs/operation-cloudyomega-ichitaro-zero-day-and-ongoing-cyberespionage-campaign-targeting-japan >

Bookworm

Names	Bookworm (<i>Palo Alto</i>)
Country	China
Motivation	Information theft and espionage
First seen	2015
Description	<p>(Palo Alto) Threat actors have delivered Bookworm as a payload in attacks on targets in Thailand. Readers who are interested in this campaign should start with our first blog that lays out the overall functionality of the malware and introduces its many components.</p> <p>Unit 42 does not have detailed targeting information for all known Bookworm samples, but we are aware of attempted attacks on at least two branches of government in Thailand. We speculate that other attacks delivering Bookworm were also targeting organizations in Thailand based on the contents of the associated decoys documents, as well as several of the dynamic DNS domain names used to host C2 servers that contain the words "Thai" or "Thailand". Analysis of compromised systems seen communicating with Bookworm C2 servers also confirms our speculation on targeting with a majority of systems existing within Thailand.</p>
Observed	Sectors: Defense and Government. Countries: Thailand.
Tools used	Bookworm, FormerFirstRAT, Poison Ivy, PlugX and Scieron.
Information	< https://unit42.paloaltonetworks.com/attack-campaign-on-the-government-of-thailand-delivers-bookworm-trojan/ > < https://unit42.paloaltonetworks.com/bookworm-trojan-a-model-of-modular-architecture/ >

Bronze Butler, Tick, RedBaldNight, Stalker Panda

Names	Bronze Butler (<i>SecureWorks</i>) Tick (<i>Symantec</i>) TEMP.Tick (<i>FireEye</i>) RedBaldNight (<i>Trend Micro</i>) Stalker Panda (<i>CrowdStrike</i>)	
Country	China	
Sponsor	State-sponsored, National University of Defense and Technology	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(SecureWorks) CTU analysis indicates that Bronze Butler primarily targets organizations located in Japan. The threat group has sought unauthorized access to networks of organizations associated with critical infrastructure, heavy industry, manufacturing, and international relations. Secureworks analysts have observed Bronze Butler exfiltrating the following categories of data:</p> <ul style="list-style-type: none">• Intellectual property related to technology and development• Product specification• Sensitive business and sales-related information• Network and system configuration files• Email messages and meeting minutes <p>The focus on intellectual property, product details, and corporate information suggests that the group seeks information that they believe might be of value to competing organizations. The diverse targeting suggests that Bronze Butler may be tasked by multiple teams or organizations with varying priorities.</p>	
Observed	Sectors: Critical infrastructure, Defense, Engineering, Government, High-Tech, Industrial, International relations, Manufacturing, Media and Technology. Countries: China, Hong Kong, Japan, Russia, Singapore, South Korea, Taiwan and USA.	
Tools used	9002 RAT, 8.t Dropper, Blogspot, Daserf, Datper, Elirks, Gh0st RAT, gsecdump, HomamDownloader, Lilith RAT, Mimikatz, Minzen, rarstar, SymonLoader and Windows Credentials Editor.	
Operations performed	Jul 2015	Symantec discovered the most recent wave of Tick attacks in July 2015, when the group compromised three different Japanese websites with a Flash (.swf) exploit to mount watering hole attacks. Visitors to these websites were infected with a downloader known as Gofarer (Downloader.Gofarer). Gofarer collects information about the compromised computer and then downloads and installs Daserf. <https://www.symantec.com/connect/blogs/tick-cyberespionage-group-zeros-japan>
	Apr 2017	Wali is a backdoor used for targeted attacks. It gathers information about the compromised machines and their networks, in addition to stealing sensitive information and credentials. Wali's operators use this information to move laterally in an organization and compromise more machines. <https://www.cybereason.com/blog/labs-shadowwali-new-variant-of-the-xxmm-family-of-backdoors>

	Nov 2017	Daserf's infection chain accordingly evolved, as shown below. It has several methods for infecting its targets of interest: spear phishing emails, watering hole attacks, and exploiting a remote code execution vulnerability (CVE-2016-7836, patched last March 2017) in SKYSEA Client View, an IT asset management software widely used in Japan. https://blog.trendmicro.com/trendlabs-security-intelligence/redbaldknight-bronze-butler-daserf-backdoor-now-using-steganography/
	Jun 2018	Tick Group Weaponized Secure USB Drives to Target Air-Gapped Critical Systems https://unit42.paloaltonetworks.com/unit42-tick-group-weaponized-secure-usb-drives-target-air-gapped-critical-systems/
	2019	Operation "ENDTRADE" By the first half of 2019, we found that the group was able to zero in on specific industries in Japan from which it could steal proprietary information and classified data. We named this campaign "Operation ENDTRADE," based on its targets. https://documents.trendmicro.com/assets/pdf/Operation-ENDTRADE-TICK-s-Multi-Stage-Backdoors-for-Attacking-Industries-and-Stealing-Classified-Data.pdf
	Jun 2019	Breach of Mitsubishi Electric https://www.zdnet.com/article/mitsubishi-electric-discloses-security-breach-china-is-main-suspect/

Buhtrap, Ratopak Spider

Names	Buhtrap (<i>Group-IB</i>) Ratopak Spider (<i>CrowdStrike</i>)	
Country	Russia	
Motivation	Financial crime	
First seen	2015	
Description	<p>(Group-IB) Buhtrap has been active since 2014, however their first attacks against financial institutions were only detected in August 2015. Earlier, the group had only focused on targeting banking clients. At the moment, the group is known to target Russian and Ukrainian banks.</p> <p>From August 2015 to February 2016 Buhtrap managed to conduct 13 successful attacks against Russian banks for a total amount of 1.8 billion rubles (\$25.7 mln). The number of successful attacks against Ukrainian banks has not been identified.</p> <p>Buhtrap is the first hacker group using a network worm to infect the overall bank infrastructure that significantly increases the difficulty of removing all malicious functions from the network. As a result, banks have to shut down the whole infrastructure which provokes delay in servicing customers and additional losses.</p> <p>Malicious programs intentionally scan for machines with an automated Bank-Customer system of the Central Bank of Russia (further referred to as BCS CBR). We have not identified incidents of attacks involving online money transfer systems, ATM machines or payment gates which are known to be of interest for other criminal groups.</p> <p>Buhtrap has some infrastructure overlap with TA505, Graceful Spider, Gold Evergreen.</p>	
Observed	Sectors: Financial and Government. Countries: Russia and Ukraine.	
Tools used	Buhtrap, FlawedAmmyy, Niteris EK and NSIS.	
Operations performed	2014	On October 20, 2014 we notified Group-IB Bot-Trek Intelligence subscribers about phishing emails which were sent from the info@beeline-mail.ru address with the subject "Invoice No 522375-ФЛОРЛ-14-115" (pic. 1). The beeline-mail.ru domain name was also registered on October 20, 2014. < https://www.group-ib.com/brochures/gib-buhtrap-report.pdf >
	Oct 2015	We noticed in late October that users visiting the Ammyy website to download the free version of its remote administrator software were being served a bundle containing not only the legitimate Remote Desktop Software Ammyy Admin, but also an NSIS (Nullsoft Scriptable Installation Software) installer ultimately intended to install the tools used by the Buhtrap gang to spy on and control their victims' computers. < https://www.welivesecurity.com/2015/11/11/operation-buhtrap-malware-distributed-via-ammyy-com/ >
	Dec 2015	In December 2015, employees from several Russian banks were targeted with spoofed emails, a common technique in attack

		<p>campaigns. The emails were made to look like they were from the Central Bank of Russia and offered employment to their recipients. Instead of being an actual employment offer, the emails were an attempt to deliver Trojan.Ratopak onto the target's computer.</p> <p><https://www.symantec.com/connect/blogs/russian-bank-employees-received-fake-job-offers-targeted-email-attack></p>
Sep 2016		<p>Breach of the Russian boxing site allboxing[.]ru</p> <p><https://www.forcepoint.com/blog/security-labs/highly-evasive-code-injection-awaits-user-interaction-delivering-malware></p>
2017		<p>Operation “TwoBee”</p> <p>Buhtrap resurfaced in the beginning of 2017 in the TwoBee campaign, where it served primarily as means of malware delivery. In March of last year, it hit the news (literally), spreading through several compromised major news outlets in whose main pages malicious actors implanted scripts. These scripts executed an exploit for Internet Explorer in visitor’s browsers.</p> <p><https://www.kaspersky.com/blog/financial-trojans-2019/25690/></p>
Jun 2019		<p>Throughout our tracking, we’ve seen this group deploy its main backdoor as well as other tools against various victims, but June 2019 was the first time we saw the Buhtrap group use a zero-day exploit as part of a campaign. In that case, we observed Buhtrap using a local privilege escalation exploit, CVE-2019-1132, against one of its victims.</p> <p><https://www.welivesecurity.com/2019/07/11/buhtrap-zero-day-espionage-campaigns/></p>
Information	<p><https://www.group-ib.com/brochures/gib-buhtrap-report.pdf></p> <p><https://www.welivesecurity.com/2015/04/09/operation-buhtrap/></p>	

Cadelle

Names	Cadelle (<i>Symantec</i>)
Country	Iran
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2011
Description	<p>(Symantec) Symantec telemetry identified Cadelle and Chafer, APT 39 activity dating from as far back as July 2014, however, it's likely that activity began well before this date. Command-and-control (C&C) registrant information points to activity possibly as early as 2011, while executable compilation times suggest early 2012. Their attacks continue to the present day. Symantec estimates that each team is made up of between 5 and 10 people.</p> <p>There is evidence to suggest that the two teams may be connected in some way, though we cannot confirm this. A number of computers experienced both Cadelspy and Remexi infections within a small time window. In one instance, a computer was compromised with Backdoor.Cadelspy just minutes after being infected with Backdoor.Remexi. The Cadelle and Chafer groups also keep the same working hours and focus on similar targets. However, no sharing of C&C infrastructure between the teams has been observed.</p> <p>If Cadelle and Chafer are not directly linked, then they may be separately working for a single entity. Their victim profile may be of interest to a nation state.</p>
Observed	Countries: Germany, Iran, Iraq, Netherlands, Pakistan, Saudi Arabia, Singapore, Sudan, Tajikistan, Thailand, Turkey, UAE, UK and USA.
Tools used	Antak and Cadelspy.
Information	< https://www.symantec.com/connect/blogs/iran-based-attackers-use-back-door-threats-spy-middle-eastern-targets >

Callisto Group

Names	Callisto Group (<i>F-Secure</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2013
Description	<p>(<i>F-Secure</i>) The most obvious common theme between all known targets of the Callisto Group is an involvement in European foreign and security policy, whether as a military or government official, being employed by a think tank, or working as a journalist. More specifically, many of the known targets have a clear relation to foreign and security policy involving both Eastern Europe and the South Caucasus.</p> <p>This targeting suggests the Callisto Group is interested in intelligence gathering related to foreign and security policy. Furthermore, we are unaware of any targeting in the described attacks that would suggest a financial motive.</p> <p>It is worth noting that during our investigation we uncovered links between infrastructure associated with the Callisto Group and infrastructure used to host online stores selling controlled substances. While we don't yet know enough to fully understand the nature of these links, they do suggest the existence of connections between the Callisto Group and criminal actors.</p> <p>While the targeting would suggest that the main benefactor of the Callisto Group's activity is a nation state with specific interest in the Eastern Europe and South Caucasus regions, the link to infrastructure used for the sale of controlled substances hints at the involvement of a criminal element. Finally, the infrastructure associated with the Callisto Group and related infrastructure contain links to at least Russia, Ukraine, and China in both the content hosted on the infrastructure, and in WHOIS information associated with the infrastructure.</p> <p>It is possible to come up with a number of plausible theories to explain the above findings. For example, a cybercrime group with ties to a nation state, such as acting on behalf of or for the benefit of a government agency, is one potential explanation. However, we do not believe it is possible to make any definitive assertions regarding the nature or affiliation of the Callisto Group based on the currently available information.</p>
Observed	Sectors: Defense, Government, Think Tanks and journalists. Countries: Europe and the South Caucasus.
Tools used	RCS Galileo.
Information	< https://www.f-secure.com/documents/996508/1030745/callisto-group >

Calypso

Names	Calypso (<i>Positive Technologies</i>)
Country	China
Motivation	Information theft and espionage
First seen	2016
Description	<p>(Positive Technologies) The PT Expert Security Center first took note of Calypso in March 2019 during threat hunting. Our specialists collected multiple samples of malware used by the group. They have also identified the organizations hit by the attackers, as well as the attackers' C2 servers.</p> <p>Our data indicates that the group has been active since at least September 2016. The primary goal of the group is theft of confidential data. Main targets are governmental institutions in Brazil, India, Kazakhstan, Russia, Thailand, and Turkey.</p> <p>Our data gives reason to believe that the APT group is of Asian origin.</p>
Observed	Sectors: Government. Countries: Belarus, Brazil, India, Kazakhstan, Mongolia, Russia, Thailand, Turkey and Ukraine.
Tools used	Byeby, Calypso RAT, DCSync, DoublePulsar, EarthWorm, EternalBlue, EternalRomance, FlyingDutchman, Hussar, Mimikatz, nbtscan, netcat, OS_Check_445, PlugX, Quarks PwDump, SysInternals, TCP Port Scanner, ZXPortMap and Living off the Land.

Carbanak, Anunak

Names	Carbanak (<i>Kaspersky</i>) Anunak (<i>Group-IB</i>) Carbon Spider (<i>CrowdStrike</i>)
Country	Ukraine
Motivation	Financial crime
First seen	2013
Description	<p>Carbanak is a threat group that mainly targets banks. It also refers to malware of the same name (Carbanak). It is sometimes referred to as FIN7, but these appear to be two groups using the same Carbanak malware and are therefore tracked separately.</p> <p>(<i>Kaspersky</i>) From late 2013 onwards, several banks and financial institutions have been attacked by an unknown group of cybercriminals. In all these attacks, a similar modus operandi was used. According to victims and the law enforcement agencies (LEAs) involved in the investigation, this could result in cumulative losses of up to 1 billion USD. The attacks are still active. This report provides a technical analysis of these attacks. The motivation for the attackers, who are making use of techniques commonly seen in Advanced Persistent Threats (APTs), appears to be financial gain as opposed to espionage. An analysis of the campaign has revealed that the initial infections were achieved using spear phishing emails that appeared to be legitimate banking communications, with Microsoft Word 97 – 2003 (.doc) and Control Panel Applet (.CPL) files attached. We believe that the attackers also redirected to exploit kits website traffic that related to financial activity.</p>
Observed	Sectors: Financial and Hospitality. Countries: Australia, Austria, Brazil, Bulgaria, Canada, China, Czech, France, Germany, Hong Kong, Iceland, India, Luxembourg, Morocco, Nepal, Norway, Pakistan, Poland, Russia, Spain, Sweden, Switzerland, Taiwan, UK, Ukraine, USA and Uzbekistan.

CardinalLizard

Names	CardinalLizard (Kaspersky)
Country	China
Motivation	Information theft and espionage
First seen	2014
Description	(Kaspersky) We are moderately confident that this is a new collection of Chinese-speaking activity targeting businesses, active since 2014. Over the last few years, the group has shown an interest in the Philippines, Russia, Mongolia and Malaysia, the latter especially prevalent during 2018. The hackers use a custom malware featuring some interesting anti-detection and anti-emulation techniques. The infrastructure used also shows some overlaps with Roaming Tiger and previous PlugX campaigns, but this could just be due to infrastructure reuse under the Chinese-speaking umbrella.
Observed	Countries: Malaysia, Mongolia, Philippines and Russia.
Tools used	PlugX.
Information	< https://securelist.com/apt-trends-report-q1-2018/85280/ >

Careto, The Mask

Names	Careto (<i>Kaspersky</i>) The Mask (<i>Kaspersky</i>) Mask (<i>Kaspersky</i>) Ugly Face (<i>Kaspersky</i>)
Country	[Unknown]
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2007
Description	<p>(<i>Kaspersky</i>) The Mask is an advanced threat actor that has been involved in cyber-espionage operations since at least 2007. The name “Mask” comes from the Spanish slang word “Careto” (“Ugly Face” or “Mask”) which the authors included in some of the malware modules.</p> <p>More than 380 unique victims in 31 countries have been observed to date. What makes “The Mask” special is the complexity of the toolset used by the attackers. This includes an extremely sophisticated malware, a rootkit, a bootkit, 32-and 64-bit Windows versions, Mac OS X and Linux versions and possibly versions for Android and iPad/iPhone (Apple iOS).</p>
Observed	Sectors: Diplomatic missions, Education, Energy and Government. Countries: Brazil, France, Germany, Iran, Libya, Morocco, Poland, South Africa, Spain, Switzerland, Tunisia, UK, USA and Venezuela.
Tools used	Careto.
Counter operations	Feb 2014 At the moment, all known Careto C&C servers are offline. The attackers began taking them offline in January 2014. We were also able to sinkhole several C&C servers, which allowed us to gather statistics on the operation. https://securelist.com/the-caretomask-apt-frequently-asked-questions/58254/
Information	< https://d2538mqr7brka.cloudfront.net/wp-content/uploads/sites/43/2018/03/20133638/unveilingthemask_v1.0.pdf > < https://securelist.com/the-caretomask-apt-frequently-asked-questions/58254/ >

Chafer, APT 39

Names	Chafer (<i>Symantec</i>) APT 39 (<i>Mandiant</i>) Remix Kitten (<i>CrowdStrike</i>) TA454 (<i>Proofpoint</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2014	
Description	<p>(FireEye) APT39 was created to bring together previous activities and methods used by this actor, and its activities largely align with a group publicly referred to as "Chafer." However, there are differences in what has been publicly reported due to the variances in how organizations track activity. APT39 primarily leverages the SEAWEED and CACHEMONEY backdoors along with a specific variant of the POWBAT backdoor. While APT39's targeting scope is global, its activities are concentrated in the Middle East. APT39 has prioritized the telecommunications sector, with additional targeting of the travel industry and IT firms that support it and the high-tech industry.</p> <p>APT39's focus on the telecommunications and travel industries suggests intent to perform monitoring, tracking, or surveillance operations against specific individuals, collect proprietary or customer data for commercial or operational purposes that serve strategic requirements related to national priorities, or create additional accesses and vectors to facilitate future campaigns. Government entities targeting suggests a potential secondary intent to collect geopolitical data that may benefit nation-state decision making. Targeting data supports the belief that APT39's key mission is to track or monitor targets of interest, collect personal information, including travel itineraries, and gather customer data from telecommunications firms.</p>	
Observed	<p>Sectors: Aviation, Engineering, Government, High-Tech, IT, Shipping and Logistics, Telecommunications and Transportation. Countries: Israel, Jordan, Kuwait, Middle East, Saudi Arabia, Spain, Turkey, UAE and USA.</p>	
Tools used	Antak, ASPXSpy, CrackMapExec, EternalBlue, HTTPSTunnel, MechaFlounder, Metasploit, Mimikatz, nbtscan, Non-sucking Service Manager, OilRig, Plink, POWBAT, pwdump, Remcom, Remexi, SEAWEED, SMB hacking tools, UltraVNC, Windows Credentials Editor and Living off the Land.	
Operations performed	2017	Chafer appears to have been undeterred by its exposure in 2015 and continued to be very active during 2017, using seven new tools, rolling out new infrastructure, and attacking nine new target organizations in the region. The group hit organizations in Israel, Jordan, the United Arab Emirates, Saudi Arabia, and Turkey. Sectors targeted included airlines; aircraft services; software and IT services companies serving the air and sea transport sectors; telecoms services; payroll services; engineering consultancies; and document management software. Outside of the Middle East, Symantec has also found evidence of attacks against one African airline and attempts to compromise an international travel reservations firm.

		< https://www.symantec.com/blogs/threat-intelligence/chafer-latest-attacks-reveal-heightened-ambitions >
	Feb 2018	Turkish Government Targeting This new secondary payload is Python-based and compiled into executable form using the PyInstaller utility. This is the first instance where Unit 42 has identified a Python-based payload used by these operators. We've also identified code overlap with OilRig's Clayside VBScript but at this time track Chafer and OilRig as separate threat groups. We have named this payload MechaFlounder for tracking purposes. < https://unit42.paloaltonetworks.com/new-python-based-payload-mechaflounder-used-by-chafer/ >
	Autumn 2018	Spying on Iran-based foreign diplomatic entities Throughout the autumn of 2018 we analyzed a long-standing (and still active at that time) cyberespionage campaign that was primarily targeting foreign diplomatic entities based in Iran. The attackers were using an improved version of Remexi in what the victimology suggests might be a domestic cyberespionage operation. < https://securelist.com/chafer-used-remexi-malware/89538/ >
	2018	Bitdefender researchers have found attacks conducted by this actor in the Middle East region, dating back to 2018. The campaigns were based on several tools, including “living off the land” tools, which makes attribution difficult, as well as different hacking tools and a custom built backdoor. < https://www.bitdefender.com/files/News/CaseStudies/study/332/Bitdefender-Whitepaper-Chafer-creat4491-en-EN-interactive.pdf >

Chimera

Names	Chimera (CyCraft)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2018	
Description	<p>(CyCraft) For nearly two years, our team monitored several attacks that targeted Taiwan's semiconductor vendors. We believe these attacks originated from the same threat actor – Chimera – as these attacks utilized similar tactics, techniques and even the same customized malware. The actor likely harvested various valid credentials via phishing emails or data breaches as their starting point to conduct their cyber attack on the vendors. Cobalt Strike was later used as their main RAT tool. To avoid detection, the Cobalt Strike RAT was often masqueraded as a Google Chrome Update. The RAT would then connect back to their C2 server. As these servers were in a public cloud server, it made it difficult to track. Subsequently, by compromising the AD server, the delicate malware – SkeletonKeyInjector – was invoked to implant a general key to allow LM, persistence and defense evasion. Although this malware was discovered for the first time, we have high confidence that these attacks were conducted by the same threat actor. Based on the stolen data, we infer that the actor's goal was to harvest company trade secrets. The motive may be related to business competition or a country's industrial strategy.</p>	
Observed	Sectors: High-Tech. Countries: Taiwan.	
Tools used	Cobalt Strike and SkeletonKeyInjector.	
Operations performed	Late 2018	Operation "Skeleton Key" https://cycraft.com/download/%5BTLP-White%5D20200415%20Chimera_V4.1.pdf
Information	https://cycraft.com/download/%5BTLP-White%5D20200415%20Chimera_V4.1.pdf	

Clever Kitten

Names	Clever Kitten (<i>CrowdStrike</i>) Group 41 (<i>Talos</i>)
Country	Iran
Motivation	Information theft and espionage
First seen	2013
Description	(<i>CrowdStrike</i>) Clever Kitten primarily targets global companies with strategic importance to countries that are contrary to Iranian interests. Clever Kitten actors have a strong affinity for PHP server-side attacks to make access; this is relatively unique amongst targeted attackers who often favor targeting a specific individual at a specific organization using social engineering. Some attackers have moved to leveraging strategic web compromises. The reason for this is likely the availability of exploits against web browsers, which for a variety of reasons allows an attacker to bypass security features such as Data Execution Prevention (DEP) or Address Space Layout Randomization (ASLR).
Observed	Global companies with strategic importance to countries that are contrary to Iranian interests.
Tools used	Acunetix Web Vulnerability Scanner, RC SHELL
Information	< https://www.crowdstrike.com/blog/whois-clever-kitten/ >

Cobalt Group

Names	Cobalt Group (<i>Group-IB</i>) Cobalt Gang (<i>Palo Alto</i>) Cobalt Spider (<i>CrowdStrike</i>) Gold Kingswood (<i>SecureWorks</i>) ATK 67 (<i>Thales</i>) TAG-CR3	
Country	Russia	
Motivation	Financial crime	
First seen	2016	
Description	Cobalt Group is a financially motivated threat group that has primarily targeted financial institutions. The group has conducted intrusions to steal money via targeting ATM systems, card processing, payment systems and SWIFT systems. Cobalt Group has mainly targeted banks in Eastern Europe, Central Asia, and Southeast Asia. The group has been known to target organizations in order to use their access to then compromise additional victims. Reporting indicates there may be links between Cobalt Group and both the malware Carbanak and the group Carbanak, Anunak .	
Observed	Sectors: Financial, High-Tech, Media and Retail. Countries: Argentina, Armenia, Austria, Azerbaijan, Belarus, Bulgaria, Canada, China, Czech, Estonia, Georgia, Italy, Jordan, Kazakhstan, Kuwait, Kyrgyzstan, Malaysia, Moldova, Netherlands, Poland, Romania, Russia, Spain, Taiwan, Tajikistan, Thailand, Turkey, UK, Ukraine, USA and Vietnam.	
Tools used	ATMSpitter, ATMRipper, AtNow, Cobalt Strike, CobInt, Cyst Downloader, FlawedAmmYY, Formbook, Little Pig, Mimikatz, Metasploit Stager, More_eggs, NSIS, Pony, Sdelete, SoftPerfect Network Scanner, SPID, Taurus Loader, ThreatKit and VenomKit.	
Operations performed	Jun 2016	In June 2016, the first attack conducted by the Cobalt group was tracked at a large Russian bank, where hackers attempted to steal money from ATMs. The attackers infiltrated the bank's network, gained control over it, compromised the domain administrator's account, and reached the ATM control server. < https://www.group-ib.com/blog/cobalt >
	Jul 2016	ATM heist at the First Commercial Bank in Taiwan < https://www.reuters.com/article/us-taiwan-cyber-atms/taiwan-atm-heist-linked-to-european-hacking-spree-security-firm-idUSKBN14P0CX >
	Aug 2016	ATM heist at the Government Saving Bank in Thailand ²
	May 2017	In May, Proofpoint observed multiple campaigns using a new version of Microsoft Word Intruder (MWI). MWI is a tool sold on underground markets for creating exploit-laden documents, generally used in targeted attacks. We previously reported about MWI when it added support for CVE-2016-4117. After the latest update, MWI is now using CVE-2017-0199 to launch an HTML Application (HTA) used for both information collection and payload execution.

² See ThaiCERT Whitepaper "ATM Heist GSB August 2016"

		This activity targets organizations in the financial vertical including banks, banking software vendors, and ATM software and hardware vendors. The emails are sent to technology and security personnel working in departments including Fraud and Information Security. <https://www.proofpoint.com/us/threat-insight/post/microsoft-word-intruder-integrates-cve-2017-0199-utilized-cobalt-group-target>
Aug 2017		The first spam run on August 31 used a Rich Text Format (RTF) document laden with malicious macros. The second, which ran from September 20 to 21, used an exploit for CVE-2017-8759 (patched last September), a code injection/remote code execution vulnerability in Microsoft's .NET Framework. The vulnerability was used to retrieve and execute Cobalt Strike from a remote server they controlled. <https://blog.trendmicro.com/trendlabs-security-intelligence/cobalt-spam-runs-use-macros-cve-2017-8759-exploit/>
Nov 2017		On Tuesday, November 21, a massive spear-phishing campaign began targeting individual employees at various financial institutions, mostly in Russia and Turkey. Purporting to provide info on changes to 'SWIFT' terms, the email contained a single attachment with no text in the body. It was an attempt by the Cobalt Group to gain a foothold in the networks of the targeted individuals' organizations. <https://www.riskiq.com/blog/labs/cobalt-strike/>
Jan 2018		Spear-phishing attacks to Russian banks The emails were sent in the name of a large European bank in an attempt to social engineer the receiver into trusting the email. The emails were quite plain with only a single question in the body and an attachment with the name once.rtf. In other cases, we saw a file with the name Заявление.rtf attached to an email that was also written in Russian. <https://www.riskiq.com/blog/labs/cobalt-group-spear-phishing-russian-banks/>
May 2018		On May 23, 1:21 p.m (Moscow time) Group-IB tracked a new large-scale Cobalt cyberattack on the leading banks of Russia and the CIS. It was like a challenge: phishing emails were sent acting as a major anti-virus vendor. Bank employees received a "complaint", in English, that their computers allegedly violated legislation. <https://www.group-ib.com/blog/renaissance>
Sep 2018		In 2018, CTU researchers observed several GOLD KINGSWOOD campaigns involving SpicyOmelette, a tool used by the group during initial exploitation of an organization. This sophisticated JavaScript remote access tool is generally delivered via phishing, and it uses multiple defense evasion techniques to hinder prevention and detection activities. <https://www.secureworks.com/blog/cybercriminals-increasingly-trying-to-ensnare-the-big-financial-fish>
Oct 2018		One of the latest examples related to the campaign under analysis was used in attacks just a few days ago. It shows the simplicity of the attack delivery employed by this group. The attack reinforces the fact that email is still one of the primary attack vectors we continuously observe. This attack begins by targeting employees at several banking entities across the globe using an email with subject "Confirmations on October 16, 2018".

Cold River

Names	Cold River (<i>Lastline</i>) Nahr el bared (<i>original place</i>) Nahr Elbard (<i>transliteration</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2019
Description	<p>(Lastline) While reviewing some network anomalies, we recently uncovered Cold River, a sophisticated threat actor making malicious use of DNS tunneling for command and control activities. We have been able to decode the raw traffic in command and control, find sophisticated lure documents used in the campaign, connect other previously unknown samples, and associate a number of legitimate organizations whose infrastructure is referenced and used in the campaign.</p> <p>The campaign targets Middle Eastern organizations largely from the Lebanon and United Arab Emirates, though, Indian and Canadian companies with interests in those Middle Eastern countries are also targeted. There are new TTPs used in this attack – for example Agent_Drable is leveraging the Django python framework for command and control infrastructure, the technical details of which are outlined later in the blog.</p>
Observed	Countries: Canada, India and Middle East (mostly Lebanon and UAE).
Tools used	DNSpionage.
Information	< https://www.lastline.com/labsblog/threat-actor-cold-river-network-traffic-analysis-and-a-deep-dive-on-agent-drable/ >

Comment Crew, APT 1

Names	Comment Crew (<i>Symantec</i>) Comment Panda (<i>CrowdStrike</i>) TG-8223 (<i>SecureWorks</i>) APT 1 (<i>Mandiant</i>) BrownFox (<i>Symantec</i>) Group 3 (<i>Talos</i>) Byzantine Hades (<i>US State Department</i>) Byzantine Candor (<i>US State Department</i>) Shanghai Group (<i>SecureWorks</i>) GIF89a (<i>Kaspersky</i>)	
Country	China	
Sponsor	State-sponsored, 2 nd Bureau of the People's Liberation Army (PLA) General Staff Department's (GSD) 3 rd Department, commonly known by its Military Unit Cover Designator (MUCD) as Unit 61398	
Motivation	Information theft and espionage	
First seen	2006	
Description	<p>Also known as APT1, Comment Crew is an advanced persistent threat (APT) group with links to the Chinese military. The threat actors, which were active from roughly 2006 to 2010, managed to strike over 140 US companies in the quest for sensitive corporate and intellectual property data.</p> <p>The group earned their name through their use of HTML comments to hide communication to the command-and-control servers. The usual attack vector was via spear-phishing campaigns utilizing emails which contained documents with names tailored for the potential victims, such as "ArmyPlansConferenceOnNewGCVSolicitation.pdf," or "Chinese Oil Executive Learning From Experience.doc."</p> <p>This group may also be responsible for the Siesta campaign.</p>	
Observed	<p>Sectors: Aerospace, Chemical, Construction, Education, Energy, Engineering, Entertainment, Financial, Food and Agriculture, Government, Healthcare, High-Tech, IT, Manufacturing, Media, Mining, Navigation, Non-profit organizations, Research, Satellites, Telecommunications, Transportation and lawyers.</p> <p>Countries: Belgium, Canada, France, India, Israel, Japan, Luxembourg, Norway, Singapore, South Africa, Switzerland, Taiwan, UAE, UK and USA.</p>	
Tools used	Auriga, bangat, BISCUIT, Bouncer, Cachedump, CALENDAR, Combos, CookieBag, Dairy, GDOCUPLOAD, GetMail, GLASSES, GLOOXMAIL, GOGGLES, GREENCAT, gsecdump, Hackfase, Helauto, Kurton, LIGHTBOLT, LIGHTDART, LONGRUN, LsIsass, ManItsMe, MAPlget, Mimikatz, MiniASP, NewsReels, Oceansalt, Pass-The-Hash Toolkit, Poison Ivy, ProcDump, pwdump, Seasalt, ShadyRAT, StarsyPound, Sword, TabMsgSQL, Tarsip, WARP, WebC2 and Living off the Land.	
Operations performed	2006-2010	Operation "Seasalt" Target: 140 US companies in the quest for sensitive corporate and intellectual property data. Method: Spear-phishing with malicious documents.

	2011-2012	Hackers Plundered Israeli Defense Firms that Built 'Iron Dome' Missile Defense System https://krebsonsecurity.com/2014/07/hackers-plundered-israeli-defense-firms-that-built-iron-dome-missile-defense-system/
	Feb 2014	Operation "Siesta" FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyberespionage unit APT 1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT 1. https://blog.trendmicro.com/trendlabs-security-intelligence/the-siesta-campaign-a-new-targeted-attack-awakens/ https://www.fireeye.com/blog/threat-research/2014/03/a-detailed-examination-of-the-siesta-campaign.html
	May 2018	Operation "Oceansalt" Target: Oceansalt appears to have been part of an operation targeting South Korea, United States, and Canada in a well-focused attack. A variation of this malware has been distributed from two compromised sites in South Korea. Method: Oceansalt appears to be the first stage of an advanced persistent threat. The malware can send system data to a control server and execute commands on infected machines, but we do not yet know its ultimate purpose. Note: It is possible that this operation was not performed by the actual Comment Crew group (as they are supposedly in jail). https://securingtomorrow.mcafee.com/other-blogs/mcafee-labs/operation-oceansalt-delivers-wave-after-wave/ https://www.mcafee.com/enterprise/en-us/assets/reports/rp-operation-oceansalt.pdf

Confucius

Names	Confucius (<i>Palo Alto</i>)	
Country	India	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(Trend Micro) Confucius' campaigns were reportedly active as early as 2013, abusing Yahoo! And Quora forums as part of their command-and-control (C&C) communications. We stumbled upon Confucius, likely from South Asia, while delving into Patchwork's cyberespionage operations.</p> <p>Confucius' operations include deploying bespoke backdoors and stealing files from their victim's systems with tailored file stealers. The stolen files are then exfiltrated by abusing a cloud service provider. Some of these file stealers specifically target files from USB devices, probably to overcome air-gapped environments.</p> <p>This group seems to be associated with Patchwork, Dropping Elephant.</p>	
Observed	Countries: Most of the South and Southeast Asian countries (including Mongolia), most of the Middle Eastern countries, with a focus on Pakistan, most of the African countries, Trinidad and Tobago and Ukraine.	
Tools used	ApacheStealer, Confucius, MY24, sctrls, remote-access-c3, sip_telephone, swissknife2 and Sneepy.	
Operations performed	Oct 2017	In recent weeks, Unit 42 has discovered three documents crafted to exploit the InPage program. InPage is a word processor program that supports languages such as Urdu, Persian, Pashto, and Arabic. The three InPage exploit files are linked through their use of very similar shellcode, which suggests that either the same actor is behind these attacks, or the attackers have access to a shared builder. https://unit42.paloaltonetworks.com/unit42-recent-inpage-exploits-lead-multiple-malware-families/
	Late 2017	Probing Confucius' infrastructure, we came across websites offering Windows and Android chat applications, most likely iterations of its predecessor, Simple Chat Point: Secret Chat Point, and Tweety Chat. We are admittedly uncertain of the extent — and success — of their use, but it's one of the ingredients of the group's operations. https://blog.trendmicro.com/trendlabs-security-intelligence/deciphering-confucius-cyberespionage-operations/
	May 2018	During their previous campaign, we found Confucius using fake romance websites to entice victims into installing malicious Android applications. This time, the threat actor seems to have a new modus operandi, setting up two new websites and new payloads with which to compromise its targets. https://blog.trendmicro.com/trendlabs-security-intelligence/confucius-update-new-tools-and-techniques-further-connections-with-patchwork/
Information	https://unit42.paloaltonetworks.com/unit42-confucius-says-malware-families-get-further-by-abusing-legitimate-websites/ https://documents.trendmicro.com/assets/research-deciphering-confucius-cyberespionage-operations.pdf	

CopyKittens, Slayer Kitten

Names	CopyKittens (<i>Trend Micro</i>) Slayer Kitten (<i>CrowdStrike</i>)	
Country	Iran	
Motivation	Information theft and espionage	
First seen	2013	
Description	CopyKittens is an Iranian cyberespionage group that has been operating since at least 2013. It has targeted countries including Israel, Saudi Arabia, Turkey, the U.S., Jordan, and Germany. The group is responsible for the campaign known as Operation Wilted Tulip.	
Observed	Sectors: Defense, Education, Government, IT and Media. Countries: Germany, Israel, Jordan, Saudi Arabia, Turkey and USA.	
Tools used	Cobalt Strike, EmpireProject, Matryoshka RAT, TDTESS, Vminst and ZPP.	
Operations performed	2013	Operation "Wilted Tulip" In this report, Trend Micro and ClearSky expose a vast espionage apparatus spanning the entire time the group has been active. It includes recent incidents as well as older ones that have not been publicly reported; new malware; exploitation, delivery and command and control infrastructure; and the group's modus operandi. We dubbed this activity Operation Wilted Tulip. <https://www.clearskysec.com/wp-content/uploads/2017/07/Operation_Wilted_Tulip.pdf>
	2015	CopyKittens has conducted at least three waves of cyber-attacks in the past year. In each of the attacks the infection method was almost identical and included an extraordinary number of stages used to avoid detection. As with other common threat actors, the group relies on social engineering methods to deceive its targets prior to infection. <https://s3-eu-west-1.amazonaws.com/minervaresearchpublic/CopyKittens/CopyKittens.pdf>
	Jan 2017	Breach of the Israeli newspaper Jerusalem Post As part of our monitoring of Iranian threat agents activities, we have detected that since October 2016 and until the end of January 2017, the Jerusalem Post, as well as multiple other Israeli websites and one website in the Palestinian Authority were compromised by Iranian threat agent CopyKittens. (<https://www.clearskysec.com/copykitten-jpost/>)
MITRE ATT&CK	(<https://attack.mitre.org/groups/G0052/>)	

Corkow, Metel

Names	Corkow (<i>Group-IB</i>) Metel (<i>Kaspersky</i>)
Country	Russia
Motivation	Financial crime
First seen	2011
Description	<p>(Group-IB) In February 2015 the first major successful attack on a Russian trading system took place, when hackers gained unsanctioned access to trading system terminals using a Trojan resulting in trades of more than \$400million.</p> <p>The criminals made purchases and sales of US dollars in the Dollar/Ruble exchange program on behalf of a bank using malware. The attack itself lasted only 14 minutes, however, it managed to cause a high volatility in the exchange rate of between 55/62 (Buy/Sell) rubles per 1 dollar instead of the 60-62 stable range.</p> <p>To conduct the attack criminals used the Corkow malware, also known as Metel, containing specific modules designed to conduct thefts from trading systems, such as QUIK operated by ARQA Technologies and TRANSAQ from ZAO "Screen market systems". Corkow provided remote access to the ITS-Broker system terminal by «Platforma soft» Ltd., which enabled the fraud to be committed.</p> <p>In August 2015 a new incident related to the Corkow (Metel) Trojan was detected. An attack on a bank card systems, which included about 250 banks which used the bank card system to service cash withdrawals from Visa and MasterCard cards under a special tariff. This attack resulted in the hundreds of millions of rubles being stolen via ATMs of the systems members.</p>
Observed	Sectors: Financial. Countries: Argentina, Austria, Belarus, Brazil, Croatia, Cyprus, Denmark, Estonia, France, Germany, Italy, Kazakhstan, Latvia, Mexico, Peru, Poland, Singapore, Spain, Switzerland, Russia, Thailand, Turkey, UK, Ukraine and USA.
Tools used	Corkow, Metel.
Information	< https://www.group-ib.ru/brochures/Group-IB-Corkow-Report-EN.pdf > < https://www.welivesecurity.com/2014/02/27/corkow-analysis-of-a-business-oriented-banking-trojan/ > < https://www.kaspersky.com/resource-center/threats/metel >

Covellite

Names	Covellite (<i>Dragos</i>)
Country	North Korea
Motivation	Information theft and espionage
First seen	2017
Description	<p>(Dragos) Covellite compromises networks associated with civilian electric energy worldwide and gathers intelligence on intellectual property and internal industrial operations. Covellite lacks an industrial control system (ICS) specific capability at this time.</p> <p>Covellite operates globally with targets primarily in Europe, East Asia, and North America. US targets emerged in September 2017 with a small, targeted phishing campaign directed at select U.S. electric companies. The phishing emails contained a malicious Microsoft Word document and infected computers with malware.</p> <p>The malicious emails discovered in the fall masqueraded as resumes or invitations. They delivered a remote access tool (RAT) payload which was used to conduct reconnaissance and enable persistent, covert access to victims' machines.</p> <p>Covellite's infrastructure and malware are similar to the hacking organization known as Lazarus Group, Hidden Cobra, Labyrinth Chollima by Novetta and Hidden Cobra by the U.S. Department of Homeland Security.</p> <p>Lazarus Group is responsible for attacks ranging from the 2014 attack on Sony Pictures to a number of Bitcoin heists in 2017. Technical analysis of Covellite malware indicates an evolution from known Lazarus toolkits. However, aside from technical overlap, it is not known how the capabilities and operations between Covellite and Lazarus are related.</p> <p>Covellite remains active but appears to have abandoned North American targets, with indications of activity in Europe and East Asia. Given the group's specific interest in infrastructure operations, rapidly improving capabilities, and history of aggressive targeting, Dragos considers this group a primary threat to the ICS industry.</p>
Observed	Sectors: Energy. Countries: East Asia, Europe and USA.
Tools used	
Information	< https://dragos.com/resource/covellite/ >

Cutting Kitten, TG-2889

Names	Cutting Kitten (<i>CrowdStrike</i>) TG-2889 (<i>SecureWorks</i>)	
Country	Iran	
Sponsor	State-sponsored, security company ITSecTeam	
Motivation	Information theft and espionage	
First seen	2012	
Description	<p>Cleaver is a threat group that has been attributed to Iranian actors and is responsible for activity tracked as Operation Cleaver. Strong circumstantial evidence suggests Cleaver is linked to Threat Group 2889 (TG-2889).</p> <p>This group evolved into Magic Hound, APT 35, Cobalt Gypsy, Charming Kitten.</p>	
Observed	<p>Sectors: Aerospace, Aviation, Chemical, Defense, Education, Energy, Financial (banks: Bank of America, US Bancorp, Fifth Third Bank, Citigroup, PNC, BB&T, Wells Fargo, Capital One and HSBC), Government, Healthcare, Oil and gas, Technology, Telecommunications, Transportation and Utilities.</p> <p>Countries: Canada, China, France, Germany, India, Israel, Kuwait, Mexico, Netherlands, Pakistan, Qatar, Saudi Arabia, South Korea, Turkey, UAE, UK and USA.</p>

Cyber Berkut

Names	Cyber Berkut (<i>self given</i>) Kiberberkut (<i>self given</i>)	
Country	Russia	
Motivation	Information theft and espionage, Sabotage and destruction	
First seen	2014	
Description	<p>(Recorded Future) Recorded Future has collected threat intelligence on the hacking activities of Cyber Berkut for over a year, aligning with the first month of ground fighting in Ukraine, at which time the group began coordinated cyber attacks. This article presents temporal and technical analysis of these activities, based on open source intelligence (OSINT) from the Web. Appropriating the Ukrainian special police force name and logo, the group has aligned itself as pro-Russian, anti-Ukrainian, and most recently attacked Western intervention efforts in the Ukrainian conflict. While the group has taken Ukrainian identities, technical links and contextual analysis connect the group to Russia.</p> <p>The group began with successful distributed denial of service (DDoS) attacks on multiple NATO websites just as separatists in the physical world were beginning to storm military buildings. Since their initial attacks the group has continued to take down websites, and most recently leaked confidential documents between US billionaire George Soros and the Ukrainian prime minister and president which contained plans for Western intervention.</p>	
Observed	Sectors: Defense, Financial and Government. Countries: Estonia, Germany, Ukraine, USA and NATO.

Dark Caracal

Names	Dark Caracal (<i>Lookout</i>) ATK 27 (<i>Thales</i>) TAG-CT3
Country	Lebanon
Sponsor	State-sponsored, General Directorate of General Security (GDGS)
Motivation	Information theft and espionage
First seen	2007
Description	<p>(<i>Lookout</i>) Lookout and Electronic Frontier Foundation (EFF) have discovered Dark Caracal³, a persistent and prolific actor, who at the time of writing is believed to be administered out of a building belonging to the Lebanese General Security Directorate in Beirut. At present, we have knowledge of hundreds of gigabytes of exfiltrated data, in 21+ countries, across thousands of victims. Stolen data includes enterprise intellectual property and personally identifiable information. We are releasing more than 90 indicators of compromise (IOC) associated with Dark Caracal including 11 different Android malware IOCs; 26 desktop malware IOCs across Windows, Mac, and Linux; and 60 domain/IP based IOCs.</p> <p>Dark Caracal targets include individuals and entities that a nation state might typically attack, including governments, military targets, utilities, financial institutions, manufacturing companies, and defense contractors. We specifically uncovered data associated with military personnel, enterprises, medical professionals, activists, journalists, lawyers, and educational institutions during this investigation. Types of data include documents, call records, audio recordings, secure messaging client content, contact information, text messages, photos, and account data.</p>
Observed	<p>Sectors: Defense, Education, Financial, Government, Healthcare, Manufacturing, Media, Utilities, activists, lawyers and journalists.</p> <p>Countries: China, France, Germany, India, Italy, Jordan, Lebanon, Nepal, Netherlands, Pakistan, Philippines, Qatar, Russia, Saudi Arabia, South Korea, Switzerland, Syria, Thailand, USA, Venezuela and Vietnam.</p>
Tools used	Bandook, CrossRAT, FinFisher and Pallas.

DarkHotel

Names	DarkHotel (<i>Kaspersky</i>) APT-C-06 (<i>Qihoo 360</i>) SIG25 (<i>NSA</i>) Dubnium (<i>Microsoft</i>) Fallout Team (<i>FireEye</i>) Shadow Crane (<i>CrowdStrike</i>) ATK 52 (<i>Thales</i>) Higaisa (<i>Tencent</i>) T-APT-02 (<i>Tencent</i>) Luder	
Country	North Korea	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2007	
Description	<p>(SecurityWeek) The activities of the DarkHotel advanced persistent threat (APT) actor came to light in November 2014, when Kaspersky published a report detailing a sophisticated cyberespionage campaign targeting business travelers in the Asia-Pacific region. The group has been around for nearly a decade and some researchers believe its members are Korean speakers.</p> <p>The attackers targeted their victims using several methods, including through their hotel's Wi-Fi, zero-day exploits and peer-to-peer (P2P) file sharing websites. Nearly one year later, the threat group was observed using new attack techniques and an exploit leaked from Italian spyware maker Hacking Team.</p> <p>DarkHotel victims have been spotted in several countries, including North Korea, Russia, South Korea, Japan, Bangladesh, Thailand, Taiwan, China, the United States, India, Mozambique, Indonesia and Germany. Up until recently, the attacks appeared to focus on company executives, researchers and development personnel from sectors such as defense industrial base, military, energy, government, NGOs, electronics manufacturing, pharmaceutical, and medical.</p> <p>In more recent DarkHotel attacks it has dubbed "Inexsmar," security firm Bitdefender said the hackers targeted political figures, and they appeared to be using some new methods.</p>	
Observed	Sectors: Defense, Energy, Government, Healthcare, Hospitality, NGOs, Pharmaceutical, Research, Technology and Chinese institutions abroad. Countries: Afghanistan, Armenia, Bangladesh, Belgium, China, Ethiopia, Germany, Greece, Hong Kong, India, Indonesia, Iran, Ireland, Israel, Italy, Japan, Kazakhstan, Kyrgyzstan, Lebanon, Malaysia, Mexico, Mozambique, North Korea, Pakistan, Philippines, Russia, Saudi Arabia, Serbia, Singapore, South Korea, Taiwan, Tajikistan, Thailand, Turkey, UAE, UK, USA, Vietnam and others.	
Tools used	Asruex, DarkHotel, DmaUp3.exe, GreezeBackdoor, Karba, msieckc.exe, Nemim, Pioneer, Ramsay, Retro and Tapaoux and various 0-days from the Hacking Team breach.	
Operations performed	2010	Operation "DarkHotel" Target: The travelers are often top executives from a variety of industries doing business and outsourcing in the APAC region.

		<p>Targets have included CEOs, senior vice presidents, sales and marketing directors and top R&D staff.</p> <p>Method: spear-phishing targets with highly advanced Flash zero-day exploits that effectively evade the latest Windows and Adobe defenses, and yet they also imprecisely spread among large numbers of vague targets with peer-to-peer spreading tactics.</p> <p>Moreover, this crew's most unusual characteristic is that for several years the Darkhotel APT has maintained a capability to use hotel networks to follow and hit selected targets as they travel around the world.</p> <p><https://securelist.com/the-darkhotel-apt/66779/></p> <p><https://www.recordedfuture.com/dark-hotel-malware/></p>
2015		<p>Darkhotel's attacks in 2015</p> <p><https://securelist.com/darkhotels-attacks-in-2015/71713/></p>
Dec 2015		<p>Operation "Daybreak"</p> <p>Method: Uses Flash zero-day exploit for CVE-2015-8651.</p> <p>Note: not the same operation as Reaper, APT 37, Ricochet Chollima, ScarCruft's Operation "Daybreak".</p>
Sep 2016		<p>Operation "Inexsmar"</p> <p>Target: seems to be used in a campaign that targets political figures rather than the usual corporate research and development personnel, CEOs and other senior corporate officials.</p> <p>Method: This attack uses a new payload delivery mechanism rather than the consecrated zero-day exploitation techniques, blending social engineering with a relatively complex Trojan to infect its selected pool of victims.</p> <p><https://labs.bitdefender.com/2017/07/inexsmar-an-unusual-darkhotel-campaign/></p>

DarkHydrus, LazyMeerkat

Names	DarkHydrus (<i>Palo Alto</i>) LazyMeerkat (<i>Kaspersky</i>) ATK 77 (<i>Thales</i>)
Country	Iran
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2016
Description	DarkHydrus is a threat group that has targeted government agencies and educational institutions in the Middle East since at least 2016. The group heavily leverages open-source tools and custom payloads for carrying out attacks. Some analysts track Dark Hydrus, APT 19 , Deep Panda , C0d0so0 and Turbine Panda , APT 26 , Shell Crew , WebMasters , KungFu Kittens as the same group, but it is unclear from open source information if the groups are the same.
Observed	Sectors: Education and Government. Countries: Iran and Middle East.
Tools used	Cobalt Strike, Mimikatz, Phishery and RogueRobin.
Operations performed	Jun 2018 On June 24, 2018, Unit 42 observed DarkHydrus carrying out a credential harvesting attack on an educational institution in the Middle East. The attack involved a spear-phishing email with a subject of "Project Offer" and a malicious Word document as an attachment. https://unit42.paloaltonetworks.com/unit42-darkhydrus-uses-phishery-harvest-credentials-middle-east/
	Jul 2018 Attack on Middle East Government This attack diverged from previous attacks we observed from this group as it involved spear-phishing emails sent to targeted organizations with password protected RAR archive attachments that contained malicious Excel Web Query files (.iqy). https://unit42.paloaltonetworks.com/unit42-new-threat-actor-group-darkhydrus-targets-middle-east-government/
	Jan 2019 New Attacks in the Middle East 360 Threat Intelligence Center captured several lure Excel documents written in Arabic in January 9, 2019. A backdoor dropped by macro in the lure documents can communicate with C2 server through DNS tunnel, as well as Google Drive API. https://ti.360.net/blog/articles/latest-target-attack-of-darkhydrus-group-against-middle-east-en/ https://unit42.paloaltonetworks.com/darkhydrus-delivers-new-trojan-that-can-use-google-drive-for-c2-communications/

DarkUniverse

Names	DarkUniverse (Kaspersky)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2017
Description	(Kaspersky) DarkUniverse is an interesting example of a full cyber-espionage framework used for at least eight years. The malware contains all the necessary modules for collecting all kinds of information about the user and the infected system and appears to be fully developed from scratch. Due to unique code overlaps, we assume with medium confidence that DarkUniverse's creators were connected with the ItaDuke set of activities. The attackers were resourceful and kept updating their malware during the full lifecycle of their operations, so the observed samples from 2017 are totally different from the initial samples from 2009. The suspension of its operations may be related to the publishing of the 'Lost in Translation' leak, or the attackers may simply have decided to switch to more modern approaches and start using more widely available artefacts for their operations.
Observed	Sectors: Defense and civilian. Countries: Afghanistan, Belarus, Ethiopia, Iran, Russia, Sudan, Syria, Tanzania, UAE and others.
Tools used	dfrgntfs5.sqt, glue30.dll, msrvct58.sqt, updater.mod and zl4vq.sqt.

Desert Falcons

Names	Desert Falcons (<i>Kaspersky</i>) APT-C-23 (<i>Qihoo 360</i>) Two-tailed Scorpion (<i>Qihoo 360</i>) ATK 66 (<i>Thales</i>) TAG-CT1	
Country	[Gaza]	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(Kaspersky) The Global Research and Analysis Team (GreAT) at Kaspersky Lab has uncovered new targeted attacks in the Middle East. Native Arabic-speaking cybercriminals have built advanced methods and tools to deliver, hide and operate malware that they have also developed themselves. This malware was originally discovered during an investigation of one of the attacks in the Middle East.</p> <p>Political activities and news are being actively used by the cybercriminals to entice victims into opening files and attachments. Content has been created with professionalism, with well-designed visuals and interesting, familiar details for the victims, as if the information were long awaited.</p> <p>The victims of the attacks to date have been carefully chosen; they are active and influential in their respective cultures, but also attractive to the cybercriminals as a source of intelligence and a target for extortion.</p> <p>The attackers have been operating for more than two years now, running different campaigns, targeting different types of victims and different types of devices (including Windows- and Android-based). We suspect that at least 30 people distributed across different countries are operating the campaigns.</p>	
Observed	<p>Sectors: Critical infrastructure, Defense, Education, Government, Media and Transportation.</p> <p>Countries: Albania, Algeria, Australia, Belgium, Bosnia and Herzegovina, Canada, China, Cyprus, Denmark, Egypt, France, Germany, Greece, Hungary, India, Iran, Iraq, Israel, Italy, Japan, Jordan, Kuwait, Lebanon, Libya, Mali, Mauritania, Mexico, Morocco, Netherlands, Norway, Pakistan, Palestine, Portugal, Qatar, Romania, Russia, Saudi Arabia, South Korea, Sudan, Sweden, Syria, Taiwan, Turkey, UAE, Ukraine, USA, Uzbekistan, Yemen and Zimbabwe.</p>	
Tools used	FrozenCell, GlanceLove, GnatSpy, KasperAgent, Micropsia, VAMP and ViperRAT.	
Operations performed	Jan 2015	Operation “Arid Viper” Operation Arid Viper attacked five Israeli-based organizations in the government, transport, infrastructure, military, and academic industries, and one organization in Kuwait using spear-phishing emails that dropped a pornographic video on a victim’s computer. <https://www.trendmicro.com/vinfo/us/security/news/cyber-attacks/sexually-explicit-material-used-as-lures-in-cyber-attacks?LinkId=12425812> <https://www.trendmicro.de/cloud-content/us/pdfs/security-intelligence/white-papers/wp-operation-arid-viper.pdf>

	Sep 2015	<p>Proofpoint researchers recently intercepted and analyzed phishing emails distributing Arid Viper malware payloads with some noteworthy updates.</p> <p>As with the originally documented examples, these messages were part of narrow campaigns targeting specific industry verticals: telecoms, high tech, and business services, primarily in Israel.</p> <p><https://www.proofpoint.com/us/threat-insight/post/Operation-Arid-Viper-Slithers-Back-Into-View></p>
	Jul 2016	<p>Around July last year, more than a 100 Israeli servicemen were hit by a cunning threat actor. The attack compromised their devices and exfiltrated data to the attackers' command and control server. In addition, the compromised devices were pushed Trojan updates, which allowed the attackers to extend their capabilities. The operation remains active at the time of writing this post, with attacks reported as recently as February 2017.</p> <p><https://securelist.com/breaking-the-weakest-link-of-the-strongest-chain/77562/></p>
	Apr 2017	<p>ThreatConnect has identified a KASPERAGENT malware campaign leveraging decoy Palestinian Authority documents. The samples date from April – May 2017, coinciding with the run up to the May 2017 Palestinian Authority elections.</p> <p><https://threatconnect.com/kasperagent-malware-campaign/></p>
	Apr 2017	<p>We identified one specific spear phishing campaign launched against targets within Palestine, and specifically against Palestinian law enforcement agencies. This campaign started in April 2017, using a spear phishing campaign to deliver the MICROPSIA payload in order to remotely control infected systems.</p> <p><https://blog.talosintelligence.com/2017/06/palestine-delphi.html></p>
	Sep 2017	<p>FrozenCell is the mobile component of a multi-platform attack we've seen a threat actor known as "Two-tailed Scorpion/APT-C-23," use to spy on victims through compromised mobile devices and desktops.</p> <p><https://blog.lookout.com/frozencell-mobile-threat></p>
	Dec 2017	<p>Recently, Trend Micro researchers came across a new mobile malware family which we have called GnatSpy. We believe that this is a new variant of VAMP, indicating that the threat actors behind APT-C-23 are still active and continuously improving their product. Some C&C domains from VAMP were reused in newer GnatSpy variants, indicating that these attacks are connected. We detect this new family as ANDROIDOS_GNATSPY.</p> <p><https://blog.trendmicro.com/trendlabs-security-intelligence/new-gnatspy-mobile-malware-family-discovered/></p>
Information	< https://media.kasperskycontenthub.com/wp-content/uploads/sites/43/2018/03/08064309/The-Desert-Falcons-targeted-attacks.pdf >	

DNSpionage

Names	DNSpionage (<i>Talos</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2019	
Description	<p>(Talos) Cisco Talos recently discovered a new campaign targeting Lebanon and the United Arab Emirates (UAE) affecting .gov domains, as well as a private Lebanese airline company. Based on our research, it's clear that this adversary spent time understanding the victims' network infrastructure in order to remain under the radar and act as inconspicuous as possible during their attacks.</p> <p>Based on this actor's infrastructure and TTPs, we haven't been able to connect them with any other campaign or actor that's been observed recently. This particular campaign utilizes two fake, malicious websites containing job postings that are used to compromise targets via malicious Microsoft Office documents with embedded macros. The malware utilized by this actor, which we are calling "DNSpionage," supports HTTP and DNS communication with the attackers.</p> <p>Talos found a possible relationship between DNSpionage and OilRig, APT 34, Helix Kitten, Chrysene.</p>	
Observed	<p>Sectors: Aviation, Government, Law enforcement, Telecommunications and Internet infrastructure.</p> <p>Countries: Albania, Cyprus, Egypt, Iraq, Jordan, Kuwait, Lebanon, Libya, North Africa, Sweden, UAE and USA.</p>	
Tools used	DNSpionage and Karkoff.	
Operations performed	Apr 2019	DNSpionage brings out the Karkoff <https://blog.talosintelligence.com/2019/04/dnsphionage-brings-out-karkoff.html>
Information	<https://blog.talosintelligence.com/2018/11/dnsphionage-campaign-targets-middle-east.html> <https://www.fireeye.com/blog/threat-research/2019/01/global-dns-hijacking-campaign-dns-record-manipulation-at-scale.html> https://www.crowdstrike.com/blog/widespread-dns-hijacking-activity-targets-multiple-sectors/ https://krebsonsecurity.com/tag/dnsphionage/	

Domestic Kitten

Names	Domestic Kitten (<i>Check Point</i>)
Country	Iran
Motivation	Information theft and espionage
First seen	2016
Description	<p>(Check Point) Recent investigations by Check Point researchers reveal an extensive and targeted attack that has been taking place since 2016 and, until now, has remained under the radar due to the artful deception of its attackers towards their targets. Through the use of mobile applications, those behind the attack use fake decoy content to entice their victims to download such applications, which are in fact loaded with spyware, to then collect sensitive information about them. Interestingly, these targets include Kurdish and Turkish natives and ISIS supporters. Most interesting of all, though, is that all these targets are actually Iranians citizens.</p> <p>Considering the nature of the target, the data collected about these groups provides those behind the campaign with highly valuable information that will no doubt be leveraged in further future action against them. Indeed, the malware collects data including contact lists stored on the victim's mobile device, phone call records, SMS messages, browser history and bookmarks, geo-location of the victim, photos, surrounding voice recordings and more.</p> <p>The targets are Kurdish and Turkish natives and ISIS supporters.</p>
Observed	Countries: Afghanistan, Iran, Iraq and UK.

Information	< https://research.checkpoint.com/domestic-kitten-an-iranian-surveillance-operation/ >

Donot Team

Names	Donot Team (ASERT) APT-C-35 (Qihoo 360) SectorE02 (ThreatRecon)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2018	
Description	<p>(ASERT) In late January 2018, ASERT discovered a new modular malware framework we call “yty”. The framework shares a striking resemblance to the EHDevel framework. We believe with medium confidence that a team we call internally as “Donot Team” is responsible for the new malware and will resume targeting of South Asia.</p> <p>In a likely effort to disguise the malware and its operations, the authors coded several references into the malware for football—it is unclear whether they mean American football or soccer. The theme may allow the network traffic to fly under the radar.</p> <p>The actors use false personas to register their domains instead of opting for privacy protection services. Depending on the registrar service chosen, this could be seen as another cost control measure. The actors often used typo-squatting to slightly alter a legitimate domain name. In contrast, the registration information used accurate spelling, possibly indicating the domain naming was intentional, typos included. Each unique registrant usually registered only a few domains, but mistakenly reused phone numbers or the registration data portrayed a similar pattern across domains.</p>	
Observed	Sectors: Government. Countries: Argentina, Bangladesh, India, Pakistan, Philippines, Sri Lanka, Thailand, UAE and UK.	
Tools used	BackConfig, EHDevel and yty.	
Operations performed	Mar 2019	From March to July this year, the ThreatRecon team noticed a spear phishing campaign by the SectorE02 group going on against the Government of Pakistan and organizations there related to defense and intelligence. https://threatrecon.nshc.net/2019/08/02/sectore02-updates-yty-framework-in-new-targeted-campaign-against-pakistan-government/
	Apr 2019	StealJob: New Android Malware Recently, we have observed a large-scale upgrade of its malicious Android APK framework to make it more stable and practical. Since the new APK framework is quite different from the one used in the past, we named it as StealJob since “job” is frequently used in the code. https://ti.360.net/blog/articles/stealjob-new-android-malware-used-by-donot-apt-group-en/
Information	https://ti.360.net/blog/articles/donot-group-is-targeting-pakistani-businessman-working-in-china-en/ https://www.netscout.com/blog/asert/donot-team-leverages-new-modular-malware-framework-south-asia

DragonOK

Names	DragonOK (<i>FireEye</i>)
Country	China
Motivation	Information theft and espionage
First seen	2015
Description	<p>DragonOK is a threat group that has targeted Japanese organizations with phishing emails. Due to overlapping TTPs, including similar custom tools, DragonOK is thought to have a direct or indirect relationship with the threat group Moafee. It is known to use a variety of malware, including Sysget/HelloBridge, PlugX, Poison Ivy, FormerFirstRat, Nflog, and NewCT.</p> <p>Kaspersky also found relations between this group and Rancor.</p>
Observed	<p>Sectors: High-Tech and Manufacturing.</p> <p>Countries: Cambodia, Japan, Russia, Taiwan and Tibet.</p>
Tools used	FormerFirstRAT, HTran, IsSpace, KHRAT, Mongall, NewCT, Nflog, PlugX, Poison Ivy, Rambo, SysGet and TidePool.
Operations performed	Jan 2015 <p>This campaign involved five separate phishing attacks, each carrying a different variant of Sysget malware, also known as HelloBridge. The malware was included as an attachment intended to trick the user into opening the malware.</p> <p>All five phishing campaigns targeted a Japanese manufacturing firm over the course of two months, but the final campaign also targeted a separate Japanese high-tech organization.</p> <p><https://unit42.paloaltonetworks.com/unit-42-identifies-new-dragonok-backdoor-malware-deployed-against-japanese-targets/></p>
	2016 <p>In recent months, Unit 42 has observed a number of attacks that we attribute to this group. Multiple new variants of the previously discussed sysget malware family have been observed in use by DragonOK. Sysget malware was delivered both directly via phishing emails, as well as in Rich Text Format (RTF) documents exploiting the CVE-2015-1641 vulnerability that in turn leveraged a very unique shellcode.</p> <p><https://unit42.paloaltonetworks.com/unit42-dragonok-updates-toolset-targets-multiple-geographic-regions/></p>
	Jan 2017 <p>Cybersecurity expert Niklas Femerstrand in an email yesterday pointed out that while servers in several different countries appear to be the origin the attack, it has been linked to the DragonOK campaign. “The DragonOK campaign has previously [in 2014] targeted organizations in Taiwan, Japan, Tibet and Russia, and political organizations in Cambodia since at least January, 2017,” he wrote, adding that there are “strong indications” the campaign is “an operation funded by China”.</p> <p><https://www.phnompenhpost.com/national/kingdom-targeted-new-malware></p>

DustSquad, Golden Falcon

Names	DustSquad (<i>Kaspersky</i>) Golden Falcon (<i>Qihoo 360</i>) APT-C-34 (<i>Qihoo 360</i>) Nomadic Octopus (<i>ESET</i>)
Country	Russia
Motivation	Information theft and espionage
First seen	2014
Description	(<i>Kaspersky</i>) For the last two years we have been monitoring a Russian-language cyberespionage actor that focuses on Central Asian users and diplomatic entities. We named the actor DustSquad and have provided private intelligence reports to our customers on four of their campaigns involving custom Android and Windows malware. In this blogpost we cover a malicious program for Windows called Octopus that mostly targets diplomatic entities. The name was originally coined by ESET in 2017 after the Oct0pus3.php script used by the actor on their old C2 servers. We also started monitoring the malware and, using Kaspersky Attribution Engine based on similarity algorithms, discovered that Octopus is related to DustSquad, something we reported in April 2018. In our telemetry we tracked this campaign back to 2014 in the former Soviet republics of Central Asia (still mostly Russian-speaking), plus Afghanistan.
Observed	Sectors: Defense, Government, Media, diplomats and dissidents. Countries: Afghanistan, Kazakhstan and Central Asia.
Tools used	Harpoon, Octopus and Remote Control System.
Information	< https://securelist.com/octopus-infested-seas-of-central-asia/88200/ > < https://www.zdnet.com/article/extensive-hacking-operation-discovered-in-kazakhstan/ >

Dust Storm

Names	Dust Storm (<i>Cylance</i>)
Country	China
Sponsor	Seems state-sponsored
Motivation	Information theft and espionage
First seen	2010
Description	<p>(<i>Cylance</i>) Very little public information was available throughout 2010 on this threat, despite the group's primary backdoor gaining some level of prominence in targeted Asian attacks. This may be explained by the group's early reliance on Dynamic DNS domains for their command and control (C2) infrastructure, as well as their use of public RATs like Poison Ivy and Gh0st RAT for second-stage implants.</p> <p>It wasn't until June 2011 that Operation Dust Storm started to garner some notoriety from a series of attacks which leveraged an unpatched Internet Explorer 8 vulnerability, CVE-2011-1255, to gain a foothold into victim networks. In these attacks, a link to the exploit was sent via a spear phishing email from a purported Chinese student seeking advice or asking the target a question following a presentation.</p> <p>As to other documented cases, the attacker started interacting with the infected machine within minutes of compromise to begin manual network and host enumeration.</p> <p>In October 2011, the group attempted to take advantage of the ongoing Libyan crisis at the time and phish the news cycle regarding Muammar Gaddafi's death on October 20, 2011. It appears that in addition to some US defense targets, this campaign was also directed at a Uyghur mailing list. This time, the group used a specially crafted malicious Windows Help (.hlp) file, which exploited CVE-2010-1885.</p>
Observed	Sectors: Energy and Oil and gas. Countries: Japan, South Korea, USA, Europe and Southeast Asia.
Tools used	Gh0st RAT, Misdat, MiS-Type, Poison Ivy and S-Type.

El Machete

Names	El Machete (<i>Kaspersky</i>) TEMP.Andromeda (<i>FireEye</i>) ATK 97 (<i>Thales</i>) TAG-NS1	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(<i>Kaspersky</i>) "Machete" is a targeted attack campaign with Spanish speaking roots. We believe this campaign started in 2010 and was renewed with an improved infrastructure in 2012. The operation may be still "active".</p> <p>The malware is distributed via social engineering techniques, which includes spear-phishing emails and infections via Web by a fake Blog website. We have found no evidence of exploits targeting zero-day vulnerabilities. Both the attackers and the victims appear to be Spanish-speaking.</p> <p>In some cases, such as Russia, the target appears to be an embassy from one of the countries of this list.</p>	
Observed	<p>Sectors: Defense, Education, Embassies, Energy, Government, and Telecommunications.</p> <p>Countries: Argentina, Belgium, Bolivia, Brazil, Canada, China, Colombia, Cuba, Dominican Republic, Ecuador, France, Germany, Guatemala, Malaysia, Mexico, Nicaragua, Peru, Russia, South Korea, Spain, Sweden, UK, Ukraine, USA and Venezuela and others.</p>	
Tools used	Machete and Living off the Land.	
Operations performed	Mar 2017	We've found that this group has continued to operate successfully, predominantly in Latin America, since 2014. All attackers simply moved to new C2 infrastructure, based largely around dynamic DNS domains, in addition to making minimal changes to the malware in order to evade signature-based detection. <https://threatvector.cyance.com/en_us/home/el-machete-malware-attacks-cut-through-latam.html>
	Mar 2019	From the end of March up until the end of May 2019, ESET researchers observed that there were more than 50 victimized computers actively communicating with the C&C server. This amounts to gigabytes of data being uploaded every week. <https://www.welivesecurity.com/2019/08/05/sharpening-machete-cyberespionage/>

EmpireMonkey, CobaltGoblin

Names	EmpireMonkey CobaltGoblin Anthropoid Spider (<i>CrowdStrike</i>)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2018	
Description	<p>(Blueliv) EmpireMonkey is an advanced financially motivated cybercriminal gang. The group gained notoriety for a heist they conducted in February 2019 against the Maltese Bank of Valletta, which initially resulted in roughly €13 million in losses, though much of this was subsequently recovered or frozen. While a thorough post-mortem of the Bank of Valletta attack has yet to be made public, it is highly likely that the threat actors sent malicious spear phishing emails to employees at Bank of Valletta and other European financial institutions. In October 2018, HSBC Malta reported receiving phishing emails that bore hallmarks of the subsequent EmpireMonkey attack against Bank of Valletta.</p> <p>This group seems to be directly related to Carbanak, Anunak and/or FIN7.</p>	
Observed	Sectors: Financial. Countries: Malta.

Energetic Bear, Dragonfly

Names	Energetic Bear (<i>CrowdStrike</i>) Dragonfly (<i>Symantec</i>) Crouching Yeti (<i>Kaspersky</i>) Group 24 (<i>Talos</i>) Koala Team (<i>iSight</i>) Iron Liberty (<i>SecureWorks</i>) TG-4192 (<i>SecureWorks</i>) Electrum (<i>Dragos</i>) ATK 6 (<i>Thales</i>)	
Country	Russia	
Sponsor	State-sponsored	
Motivation	Sabotage and destruction	
First seen	2011	
Description	<p>Dragonfly is a cyberespionage group that has been active since at least 2011. They initially targeted defense and aviation companies but shifted to focus on the energy sector in early 2013. They have also targeted companies related to industrial control systems.</p> <p>According to Kaspersky, Crouching Yeti has been operating since at least 2010 and has infected roughly 2,800 targets in 38 countries, and in industries as diverse as education and pharmaceuticals.</p> <p>A similar group emerged in 2015 and was identified by Symantec as Berserk Bear, Dragonfly 2.0. There is debate over the extent of the overlap between Dragonfly and Dragonfly 2.0, but there is sufficient evidence to lead to these being tracked as two separate groups.</p>	
Observed	<p>Sectors: Aviation, Construction, Defense, Education, Energy, Industrial, IT, Manufacturing, Oil and gas and Pharmaceutical.</p> <p>Countries: Canada, France, Germany, Greece, Italy, Norway, Poland, Romania, Russia, Serbia, Spain, Turkey, UK, Ukraine and USA.</p>	
Tools used	Commix, CrackMapExec, Dirsearch, Dorshel, Havex RAT, Hello EK, Heriplor, Impacket, Industroyer, Inveigh, Karagany, LightsOut EK, Listrix, nmap, Oldrea, PHPMailer, PsExec, SMBTrap, sqlmap, Subbrute, Sublist3r, Sysmain, Wpscan and WSO.	
Operations performed	Feb 2013	Spam campaign The Dragonfly group has used at least three infection tactics against targets in the energy sector. The earliest method was an email spear phishing campaign, which saw selected executives and senior employees in target companies receive emails containing a malicious PDF attachment. Infected emails had one of two subject lines: "The account" or "Settlement of delivery problem". <https://www.symantec.com/content/en/us/enterprise/media/security_response/whitepapers/Dragonfly_Threat_Against_Western_Energy_Suppliers.pdf>
	Jun 2013	Watering Hole Attacks using Lightsout In June 2013, the attackers shifted their focus to watering hole attacks. They compromised a number of energy-related websites and

		injected an iframe into each of them. This iframe then redirected visitors to another compromised legitimate website hosting the Lightsout exploit kit. This in turn exploited either Java or Internet Explorer in order to drop Oldrea or Karagany on the victim's computer.
Sep 2013	Watering Hole Attacks using Hello In September 2013, Dragonfly began using a new version of this exploit kit, known as the Hello exploit kit. The landing page for this kit contains JavaScript which fingerprints the system, identifying installed browser plugins. The victim is then redirected to a URL which in turn determines the best exploit to use based on the information collected.	
2013	Trojanized software The most ambitious attack vector used by Dragonfly was the compromise of a number of legitimate software packages. Three different ICS equipment providers were targeted and malware was inserted into the software bundles they had made available for download on their websites.	
Feb 2014	LightsOut EK Targets Energy Sector Late last year, the story broke that threat actors were targeting the energy sector with Remote Access Tools and Intelligence gathering malware. It would seem that the attackers responsible for this threat are back for more. This particular APT struck late February between 2/24-2/26. < https://www.zscaler.com/blogs/research/lightsout-ek-targets-energy-sector >	
Dec 2015	Attack on Energy Companies in the Ukraine According to a statement posted this week on the official website of the Ukrainian security service SBU, Russian special services allegedly planted malware on the networks of several regional power companies. The malicious software is said to have been discovered by employees of the SBU. The SBU said the attackers also flooded the targeted companies' technical support phone lines. The agency removed the malware and launched an investigation. Just before Christmas, power outages were reported in the Ivano-Frankivsk Oblast region of Ukraine. The outages were blamed on outsiders who remotely tampered with automatic control systems. The power company responsible for the region also reported that its call center suffered a technical failure caused by a barrage of calls. < https://ssu.gov.ua/sbu/control/uk/publish/article?art_id=170951&cat_id=39574 >	
2016	This report by Kaspersky Lab ICS CERT presents information on identified servers that have been infected and used by the group. The report also includes the findings of an analysis of several web servers compromised by the Energetic Bear group during 2016 and in early 2017. < https://securelist.com/energetic-bear-crouching-yeti/85345/ >	
Dec 2016	Power outage at Ukrrenergo in the Ukraine Preliminary findings indicate that workstations and Supervisory Control and Data Acquisition (SCADA) systems, linked to the 330 kilowatt sub-station "North", were influenced by external sources	

		<p>outside normal parameters, Ukrrenergo said in comments emailed to Reuters.</p> <p><https://www.reuters.com/article/us-ukraine-cyber-attack-energy-idUSKBN1521BA></p> <p><https://dragos.com/wp-content/uploads/CrashOverride-01.pdf></p> <p><https://dragos.com/wp-content/uploads/CRASHOVERRIDE.pdf></p>
	Apr 2017	<p>Breach of EirGrid in the UK</p> <p>The breach of the Vodafone network allowed the hackers to create a type of wiretap known as Generic Routing Encapsulation (GRE) to tunnel into EirGrid's Vodafone router located in Shotton.</p> <p><https://www.independent.ie/irish-news/statesponsored-hackers-targeted-eirgrid-electricity-network-in-devious-attack-36005921.html></p>
	May 2017	<p>Watering Hole Attack on Turkish critical infrastructure</p> <p>Through our web crawling network, we were able to determine that a website belonging to a Turkish energy company was being used in a watering hole attack targeting people associated with Turkish critical infrastructure. Compromised via a supply chain attack, the site was injected with SMB credential-harvesting malware.</p> <p><https://www.riskiq.com/blog/labs/energetic-bear/></p>

Equation Group

Names	Equation Group (<i>real name</i>) Tilded Team (<i>CrySys</i>)
Country	USA
Sponsor	State-sponsored, believed to be tied to the NSA's Tailored Access Operations unit
Motivation	Information theft and espionage, Sabotage and destruction
First seen	2001
Description	<p>(Ars Technica) Kaspersky researchers have documented 500 infections by Equation Group in at least 42 countries, with Iran, Russia, Pakistan, Afghanistan, India, Syria, and Mali topping the list. Because of a self-destruct mechanism built into the malware, the researchers suspect that this is just a tiny percentage of the total; the actual number of victims likely reaches into the tens of thousands. A long list of almost superhuman technical feats illustrate Equation Group's extraordinary skill, painstaking work, and unlimited resources. They include:</p> <ul style="list-style-type: none">• The use of virtual file systems, a feature also found in the highly sophisticated Regin malware. Recently published documents provided by Ed Snowden indicate that the NSA used Regin to infect the partly state-owned Belgian firm Belgacom.• The stashing of malicious files in multiple branches of an infected computer's registry. By encrypting all malicious files and storing them in multiple branches of a computer's Windows registry, the infection was impossible to detect using antivirus software.• Redirects that sent iPhone users to unique exploit Web pages. In addition, infected machines reporting to Equation Group command servers identified themselves as Macs, an indication that the group successfully compromised both iOS and OS X devices.• The use of more than 300 Internet domains and 100 servers to host a sprawling command and control infrastructure.• USB stick-based reconnaissance malware to map air-gapped networks, which are so sensitive that they aren't connected to the Internet. Both Stuxnet and the related Flame malware platform also had the ability to bridge airgaps.• An unusual if not truly novel way of bypassing code-signing restrictions in modern versions of Windows, which require that all third-party software interfacing with the operating system kernel be digitally signed by a recognized certificate authority. To circumvent this restriction, Equation Group malware exploited a known vulnerability in an already signed driver for CloneCD to achieve kernel-level code execution. <p>Taken together, the accomplishments led Kaspersky researchers to conclude that Equation Group is probably the most sophisticated computer attack group in the world, with technical skill and resources that rival the groups that developed Stuxnet and the Flame espionage malware in Operation Olympic Games.</p> <p>Other publicly exposed major APT activities from the NSA involve the wholesale worldwide spying from programs such as PRISM and, together with GCHQ, INCENSER, where various international Internet trunks were tapped.</p>

	<p>Their arsenal of 0-day cyber weapons was stolen by an actor Shadow Brokers, who leaked a large section on the internet⁴ and tried to sell the rest afterward.</p> <p>Most notable among the dumps were 0-days such as ETERNALBLUE and ETERNALROMANCE that were used by other groups for the creation of infamous ransomware explosions such as WannaCry and NotPetya.</p> <p>Equation Group is also linked to the creation of the Stuxnet worm that aimed to sabotage nuclear reactors in Iran in 2010, and/or the “follow-up” threats Duqu, Flame or Gauss. Although neither country has openly admitted responsibility, Stuxnet is believed to be a jointly built American/Israeli (allegedly, Unit 8200) cyber weapon.</p> <p><https://en.wikipedia.org/wiki/Stuxnet></p>

Evil Eye

Names	Evil Eye (<i>Volexity</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2019	
Description	<p>(<i>Volexity</i>) Volexity has been able to identify at least 11 different Uyghur and East Turkistan websites that have been strategically compromised and leveraged as part of a series of attack campaigns. In some cases, the websites have been continuously leveraged to attack visitors going back at least four years. While it is not always possible to tie some observed activity to a specific threat group, Volexity believes that at least two Chinese APT groups are responsible for the majority of the attack activity described in this blog.</p> <p>In many cases where the malicious websites were in operation but Volexity did not observe an active payload, the URLs followed a somewhat distinctive pattern. In almost all instances, the URLs from these sites were loaded via an iFrame.</p> <p>These URLs are typically loaded in plaintext without any sort of obfuscation. However, in two instances, one of the earlier instances identified on the Uyghur Academy website, and one on the website of the World Uyghurs Writers Union, obfuscation was applied by way of multiple iFrames, and with the URL itself being obfuscated.</p> <p>Volexity has also observed similar URL patterns and even doppelganger domains leveraged to target Tibetan interests as well. Volexity believes there is likely overlap between these two sets of activity. Volexity currently tracks the above listed activity as a group under the moniker Evil Eye. The Evil Eye threat actor is also responsible for targeting users with Android exploits and malware.</p>	
Observed	Sectors: Uyghurs.

FIN4, Wolf Spider

Names	FIN4 (FireEye) Wolf Spider (CrowdStrike)
Country	Romania
Motivation	Financial crime
First seen	2013
Description	<p>(FireEye) FireEye tracks a threat group that we call “FIN4,” whose intrusions seem to have a different objective: to obtain an edge in stock trading. FIN4 appears to conduct intrusions that are focused on a single objective: obtaining access to insider information capable of making or breaking the stock prices of public companies. The group specifically targets the emails of C-level executives, legal counsel, regulatory, risk, and compliance personnel, and other individuals who would regularly discuss confidential, market-moving information.</p> <p>FIN4 has targeted over 100 companies since at least mid-2013. All of the targeted organizations are either public companies or advisory firms that provide services to public companies (such as investor relations, legal, and investment banking firms). Over two-thirds of the targeted organizations are healthcare and pharmaceutical companies. FIN4 probably focuses on these types of organizations because their stocks can move dramatically in response to news of clinical trial results, regulatory decisions, or safety and legal issues.</p>
Observed	Sectors: Financial, Healthcare and Pharmaceutical.
Tools used	UpDocX

MITRE ATT&CK	< https://attack.mitre.org/groups/G0085/ >

FIN5

Names	FIN5 (<i>FireEye</i>)
Country	[Unknown]
Motivation	Financial crime
First seen	2008
Description	<p>FIN5 is a financially motivated threat group that has targeted personally identifiable information and payment card information. The group has been active since at least 2008 and has targeted the restaurant, gaming, and hotel industries. The group is made up of actors who likely speak Russian.</p> <p>(DarkReading) No 0days. No spear-phishing, either: The cybercriminal group tied to numerous payment card breaches including Goodwill and best known by its so-called “RawPOS” malware employed legitimate user credentials to access its targets’ networks.</p> <p>Researchers at FireEye here today shared their recent findings on this prolific and long-running cybercrime gang that has been the subject of multiple Visa security alerts to merchants. The RawPOS memory scraper malware has been infecting the lodging industry in epidemic proportions over the past year, and is considered one of the first memory scrapers to target point-of-sale systems.</p> <p>FireEye has dubbed the cybercrime gang FIN5. “One of the most unique things about FIN5 is that in every intrusion we responded to where FIN5 has been active, legitimate access was identified. They had valid user credentials to remotely log into the network,” said Barry Vengerik, principal threat analyst at FireEye. “No sexy zero-days, no remote exploits – not even spear-phishing. They had credentials from somewhere.”</p> <p>FIN5, which earlier this year was profiled by researchers at Trend Micro and has been in action since at least 2008, uses real credentials from the victim organization’s virtual private network, Remote Desktop Protocol, Citrix, or VNC. Vengerik says the attackers got those credentials via third parties associated with the victims’ POS systems.</p>

FIN7

Names	FIN7 (<i>FireEye</i>) ATK 32 (<i>Thales</i>) APT-C-11 (<i>Qihoo 360</i>) TAG-CR1	
Country	Russia	
Motivation	Financial crime	
First seen	2013	
Description	<p>FIN7 is a financially-motivated threat group that has primarily targeted the U.S. retail, restaurant, and hospitality sectors since mid-2015. They often use point-of-sale malware. A portion of FIN7 was run out of a front company called Combi Security. FIN7 is sometimes referred to as Carbanak, Anunak, but these appear to be two groups using the same Carbanak malware and are therefore tracked separately.</p> <p>The reports about arrests made of the mastermind of Carbanak instead of FIN7. However, security research teams keep referring to this arrest for all FIN7 activities since.</p>	
Observed	<p>Sectors: Casinos and Gambling, Construction, Education, Energy, Financial, Government, High-Tech, Hospitality, Retail, Technology, Telecommunications and Transportation.</p> <p>Countries: Australia, France, Malta, UK and USA.</p>	
Tools used	7Logger, Astra, Bateleur, BIOLOAD, Boostwrite, Carbanak, Cobalt Strike, DNSMessenger, Griffon, HALFBAKED, Meterpreter, Mimikatz, POWERSOURCE, RDFSNIFFER and SQLRAT.	
Operations performed	Feb 2017	<p>In late February 2017, FireEye as a Service (FaaS) identified a spear phishing campaign that appeared to be targeting personnel involved with United States Securities and Exchange Commission (SEC) filings at various organizations.</p> <p>All of the observed intended recipients of the spear phishing campaign appeared to be involved with SEC filings for their respective organizations.</p> <p><https://www.fireeye.com/blog/threat-research/2017/03/fin7_spear_phishing.html></p>
	Mar 2017	<p>Two recent fileless malware campaigns targeting financial institutions, government agencies and other enterprises have been linked to the same attack group.</p> <p>The campaigns, disclosed by Kaspersky Lab and Cisco's Talos research outfit in the last five weeks, made extensive use of fileless malware and known penetration testing tools and utilities to spy on organizations and move data and money off of networks.</p> <p><https://threatpost.com/fileless-malware-campaigns-tied-to-same-attacker/124369/></p>
	Apr 2017	<p>In a newly-identified campaign, FIN7 modified their phishing techniques to implement unique infection and persistence mechanisms. FIN7 has moved away from weaponized Microsoft Office macros in order to evade detection. This round of FIN7 phishing lures implements hidden shortcut files (LNK files) to initiate the</p>

		infection and VBScript functionality launched by mshta.exe to infect the victim. <https://www.fireeye.com/blog/threat-research/2017/04/fin7-phishing-lnk.html>
Jul 2017		Proofpoint researchers have uncovered that the threat actor commonly referred to as FIN7 has added a new Jscript backdoor called Bateleur and updated macros to its toolkit. <https://www.proofpoint.com/us/threat-insight/post/fin7carbanak-threat-actor-unleashes-bateleur-jscript-backdoor>
2017		Leveraging Shim Databases for Persistence A unique aspect of the incidents was how the group installed the CARBANAK backdoor for persistent access. Mandiant identified that the group leveraged an application shim database to achieve persistence on systems in multiple environments. The shim injected a malicious in-memory patch into the Services Control Manager ("services.exe") process, and then spawned a CARBANAK backdoor process. <https://www.fireeye.com/blog/threat-research/2017/05/fin7-shim-databases-persistence.html>
Jun 2017		Highly sophisticated fileless attack targeting restaurants across the US On June 7, 2017, Morphisec Lab identified a new, highly sophisticated fileless attack targeting restaurants across the US. The ongoing campaign allows hackers to seize system control and install a backdoor to steal financial information at will. It incorporates some never before seen evasive techniques that allow it to bypass most security solutions – signature and behavior based. <http://blog.morphisec.com/fin7-attacks-restaurant-industry>
Oct 2017		Attack to target banks and the enterprise Like clockwork, FIN7 again unleashed a new attack able to bypass almost every security solution. The attack, which took place between October 8 to 10, 2017, is yet another demonstration of the high-paced innovation by threat actors. <http://blog.morphisec.com/fin7-attack-modifications-revealed>
May 2018		New Attack Panel and Malware Samples Flashpoint analysts recently uncovered a new attack panel used by this group in campaigns they have called Astra. The panel, written in PHP, functions as a script-management system, pushing attack scripts down to compromised computers. <https://www.flashpoint-intel.com/blog/fin7-revisited-inside-astra-panel-and-sqlrat-malware/>
2018		High-profile breaches including Red Robin, Chili's, Arby's, Burgerville, Omni Hotels and Saks Fifth Avenue, among many others. Fifth Avenue, Saks Off 5 th , and Lord & Taylor department stores—all owned by The Hudson's Bay Company—acknowledged a data breach impacting more than five million credit and debit card numbers. The culprits? The same group that's spent the last few years pulling off data heists from Omni Hotels & Resorts, Trump Hotels, Jason's Deli, Whole Foods, Chipotle: A mysterious group known as Fin7. <http://blog.morphisec.com/fin7-not-finished-morphisec-spots-new-campaign>

	Nov 2018	In this blog post, we present our findings on two campaigns, which occurred in the first and second weeks of November. These campaigns follow patterns similar to those presented by FireEye in August but with just enough variations to bypass many security vendors. <http://blog.morphisec.com/fin7-not-finished-morphisec-spots-new-campaign>
	2018-2019	In 2018-2019, researchers of Kaspersky Lab's Global Research and Analysis Team analyzed various campaigns that used the same Tactics Tools and Procedures (TTPs) as the historic FIN7, leading the researchers to believe that this threat actor had remained active despite the 2018 arrests. In addition, during the investigation, we discovered certain similarities to other attacker groups that seemed to share or copy the FIN7 TTPs in their own operations. <https://securelist.com/fin7-5-the-infamous-cybercrime-rig-fin7-continues-its-activities/90703/>
	Jan 2019	The shared codebase with recent tools attributed to FIN7, together with the same techniques and backdoor, allows to attribute this new loader to the cybercrime group. The timestamps, together with simpler functionality, suggest BIOLOAD is a preceding iteration of BOOSTWRITE. Since the loader is specifically built for each targeted machine and requires administrative permissions to deploy, it suggests the group gathers information about its targets' networks. <https://www.fortinet.com/blog/threat-research/bioload-fin7-boostwrite-lost-twin.html>
	Oct 2019	In this blog, we reveal two of FIN7's new tools that we have called BOOSTWRITE and RDFSNIFFER. <https://www.fireeye.com/blog/threat-research/2019/10/mahalo-fin7-responding-to-new-tools-and-techniques.html>
	Mar 2020	A US hospitality provider has recently been the target of an incredibly rare BadUSB attack, ZDNet has learned from cyber-security firm Trustwave. The attack happened after the company received an envelope containing a fake BestBuy gift card, along with a USB thumb drive. <https://www.zdnet.com/article/rare-badusb-attack-detected-in-the-wild-against-us-hospitality-provider/>

MITRE ATT&CK

<<https://attack.mitre.org/groups/G0046/>>

FIN8

Names	FIN8 (FireEye) ATK 113 (Thales)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2016	
Description	<p>(FireEye) We attribute the use of this EoP to a financially motivated threat actor. In the past year, not only have we observed this group using similar infrastructure and tactics, techniques, and procedures (TTPs), but they are also the only group we have observed to date who uses the downloader PUNCHBUGGY and POS malware PUNCHTRACK. Designed to scrape both Track 1 and Track 2 payment card data, PUNCHTRACK is loaded and executed by a highly obfuscated launcher and is never saved to disk.</p> <p>This actor has conducted operations on a large scale and at a rapid pace, displaying a level of operational awareness and ability to adapt their operations on the fly. These abilities, combined with targeted usage of an EoP exploit and the reconnaissance required to individually tailor phishing emails to victims, potentially speaks to the threat actors' operational maturity and sophistication.</p> <p>FireEye identified more than 100 organizations in North America that fell victim to this campaign.</p>	
Observed	Sectors: Entertainment, Food and Agriculture, Healthcare, Hospitality and Retail. Countries: USA.	
Tools used	BadHatch, PoSlurp, PunchBuggy.	
Operations performed	Mar 2016	Tailored spear-phishing campaigns In March 2016, a financially motivated threat actor launched several tailored spear phishing campaigns primarily targeting the retail, restaurant, and hospitality industries. The emails contained variations of Microsoft Word documents with embedded macros that, when enabled, downloaded and executed a malicious downloader that we refer to as PUNCHBUGGY. <https://www.fireeye.com/blog/threat-research/2016/05/windows-zero-day-payment-cards.html>
	2017	In early 2017, FIN8 began using environment variables paired with PowerShell's ability to receive commands via stdin (standard input) to evade detection based on process command line arguments. In the February 2017 phishing document "COMPLAINT Homer Glynn.doc" <https://www.fireeye.com/blog/threat-research/2017/06/obfuscation-in-the-wild.html>
	Mar 2019	During the period of March to May 2019, Morphisec Labs observed a new, highly sophisticated variant of the ShellTea / PunchBuggy backdoor malware that attempted to infiltrate a number of machines within the network of a customer in the hotel-entertainment industry. It is believed that the malware was deployed as a result of several phishing attempts. <http://blog.morphisec.com/security-alert-fin8-is-back>

	Jul 2019	This blog will introduce a new reverse shell from FIN8, dubbed BADHATCH and compare publicly reported versions of ShellTea and PoSlurp to variants observed by Gigamon Applied Threat Research (ATR). < https://atr-blog.gigamon.com/2019/07/23/abadbabe-8badf00d-discovering-badhatch-and-a-detailed-look-at-fin8's-tooling/ >
MITRE ATT&CK		< https://attack.mitre.org/groups/G0061/ >

FIN10

Names	FIN10 (FireEye)
Country	[Unknown]
Motivation	Financial crime
First seen	2016
Description	(FireEye) FireEye has observed multiple targeted intrusions occurring in North America — predominately in Canada — dating back to at least 2013 and continuing through at least 2016, in which the attacker(s) have compromised organizations' networks and sought to monetize this illicit access by exfiltrating sensitive data and extorting victim organizations. In some cases, when the extortion demand was not met, the attacker(s) destroyed production Windows systems by deleting critical operating system files and then shutting down the impacted systems. Based on near parallel TTPs used by the attacker(s) across these targeted intrusions, we believe these clusters of activity are linked to a single, previously unobserved actor or group that we have dubbed FIN10.
Observed	Sectors: Casinos and Gambling and Mining. Countries: Canada and USA.
Tools used	EmpireProject and KOMPROGO.
Information	< https://www2.fireeye.com/rs/848-DID-242/images/rpt-fin10.pdf >
MITRE ATT&CK	< https://attack.mitre.org/groups/G0051/ >

Fishing Elephant

Names	Fishing Elephant (Kaspersky)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2019
Description	(Kaspersky) During the last months of 2019, we observed an ongoing campaign conducted by Fishing Elephant. The group continues to use both Heroku and Dropbox in order to deliver its tool of choice, AresRAT. We discovered that the actor incorporated a new technique into its operations that is meant to hinder manual and automatic analysis – geo-fencing and hiding executables within certificate files. During our research, we also detected a change in victimology that may reflect the current interests of the threat actor: the group is targeting government and diplomatic entities in Turkey, Pakistan, Bangladesh, Ukraine and China.
Observed	Sectors: Government. Countries: Bangladesh, China, Pakistan, Turkey and Ukraine.
Tools used	AresRAT.
Information	< https://securelist.com/apt-trends-report-q1-2020/96826/ >

Flying Kitten, Ajax Security Team

Names	Flying Kitten (<i>CrowdStrike</i>) Ajax Security Team (<i>FireEye</i>) Group 26 (<i>Talos</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(<i>FireEye</i>) Members of this group have accounts on popular Iranian hacker forums such as ashiyane[.]org and shabgard[.]org, and they have engaged in website defacements under the group name “AjaxTM” since 2010. By 2014, the Ajax Security Team had transitioned from performing defacements (their last defacement was in December 2013) to malware-based espionage, using a methodology consistent with other advanced persistent threat actors in this region.</p> <p>(<i>CrowdStrike</i>) CrowdStrike Intelligence has also been tracking and reporting internally on this threat group since mid-January 2014 under the name FLYING KITTEN, and since that time has seen targeting of multiple U.S.-based defense contractors as well as political dissidents.</p>	
Observed	Sectors: Defense and dissidents. Countries: USA.	
Tools used	Stealer.	
Operations performed	2013	Operation “Saffron Rose” < https://www.fireeye.com/content/dam/fireeye-www/global/en/current-threats/pdfs/rpt-operation-saffron-rose.pdf >

FunnyDream

Names	FunnyDream (<i>Kaspersky</i>)
Country	China
Motivation	Information theft and espionage
First seen	2018
Description	<p>In early 2020 Kaspersky published a report based on its investigation of an ongoing attack campaign called “FunnyDream”. This Chinese-speaking actor has been active for at least a few years and possesses different implants with various capabilities.</p> <p>Since mid-2018, researchers at Kaspersky saw continuing high activity from this threat actor and among their targets were a number of high-level government organisations as well as some political parties from various Asian countries including the Philippines, Thailand, Vietnam, and Malaysia.</p> <p>The campaign comprises a number of cyber espionage tools with various capabilities. As of the latest monitoring of the global cybersecurity company, FunnyDream's espionage attacks are still ongoing.</p>
Observed	Sectors: Government. Countries: Malaysia, Philippines, Taiwan, Thailand and Vietnam.
Tools used	
Information	< https://www.digitalnewsasia.com/business/kaspersky-2019-apt-report-cyberspying-groups-hunt-intelligence-sea >

Gallium

Names	Gallium (<i>Microsoft</i>)
Country	China
Motivation	Information theft and espionage
First seen	2018
Description	<p>(Microsoft) To compromise targeted networks, GALLIUM target unpatched internet-facing services using publicly available exploits and have been known to target vulnerabilities in WildFly/Jboss. Once persistence is established in a network, GALLIUM uses common techniques and tools like Mimikatz to obtain credentials that allows for lateral movement across the target network. Within compromised networks, GALLIUM makes no attempt to obfuscate their intent and are known to use common versions of malware and publicly available toolkits with small modifications. The operators rely on low cost and easy to replace infrastructure that consists of dynamic-DNS domains and regularly reused hop points.</p> <p>This activity from GALLIUM has been identified predominantly through 2018 to mid-2019. GALLIUM is still active; however, activity levels have dropped when compared to what was previously observed.</p>
Observed	Sectors: Telecommunications.
Tools used	BlackMould, China Chopper, Htran, nbtscan, netcat, Mimikatz, Poison Ivy, PsExec, QuarkBandit, SoftEther VPN, Windows Credentials Editor and WinRAR.
Information	< https://www.microsoft.com/security/blog/2019/12/12/gallium-targeting-global-telecom/ >

Gallmaker

Names	Gallmaker (Symantec)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2017
Description	<p>(Symantec) Symantec researchers have uncovered a previously unknown attack group that is targeting government and military targets, including several overseas embassies of an Eastern European country, and military and defense targets in the Middle East. This group eschews custom malware and uses living off the land (LotL) tactics and publicly available hack tools to carry out activities that bear all the hallmarks of a cyber espionage campaign.</p> <p>The group, which we have given the name Gallmaker, has been operating since at least December 2017, with its most recent activity observed in June 2018.</p>
Observed	Sectors: Defense, Embassies and Government. Countries: Eastern Europe and Middle East.
Tools used	Living off the Land.
Information	< https://www.symantec.com/blogs/threat-intelligence/gallmaker-attack-group >
MITRE ATT&CK	< https://attack.mitre.org/groups/G0084/ >

Gamaredon Group

Names	Gamaredon Group (<i>Palo Alto</i>) Winterflounder (<i>iDefense</i>) Primitive Bear (<i>CrowdStrike</i>)	
Country	Russia	
Sponsor	State-sponsored, FSB 16 th & 18 th Centers	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(Lookingglass) The Lookingglass Cyber Threat Intelligence Group (CTIG) has been tracking an ongoing cyber espionage campaign named "Operation Armageddon". The name was derived from multiple Microsoft Word documents used in the attacks. "Armagedon" (spelled incorrectly) was found in the "Last Saved By" and "Author" fields in multiple Microsoft Word documents. Although continuously developed, the campaign has been intermittently active at a small scale, and uses unsophisticated techniques. The attack timing suggests the campaign initially started due to Ukraine's decision to accept the Ukraine---European Union Association Agreement (AA). The agreement was designed to improve economic integrations between Ukraine and the European Union. Russian leaders publicly stated that they believed this move by Ukraine directly threatened Russia's national security. Although initial steps to join the Association occurred in March 2012, the campaign didn't start until much later (mid-2013), as Ukraine and the EU started to more actively move towards the agreement.</p> <p>Russian actors began preparing for attacks in case Ukraine finalized the AA. The earliest identified modification timestamp of malware used in this campaign is June 26, 2013. A group of files with modification timestamps between August 12 and September 16, 2013 were used in the first wave of spear-phishing attacks, targeting government officials prior to the 10th Yalta Annual Meeting: "Changing Ukraine in a Changing World: Factors of Success."</p>	
Observed	Sectors: Defense, Government, Law enforcement, NGOs, diplomats and journalists. Countries: Ukraine.	
Tools used	Aversome infector, EvilGnome, FRAUDROP, Gamaredon, Pteranodon, RMS, Resetter and UltraVNC.	
Operations performed	Apr 2019	The discovered attack appears to be designed to lure military personnel: it leverages a legit document of the "State of the Armed Forces of Ukraine" dated back in the 2 nd April 2019. https://blog.yoroi.company/research/the-russian-shadow-in-eastern-europe-ukrainian-mod-campaign/
	May 2019	The Gamaredon attacks against Ukraine doesn't seem to have stopped. After a month since our last report we spotted a new suspicious email potentially linked to the Gamaredon group. https://blog.yoroi.company/research/the-russian-shadow-in-eastern-europe-a-month-later/

Gangnam Industrial Style

Names	Gangnam Industrial Style (CyberX)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2019
Description	<p>(CyberX) Section 52, CyberX's threat intelligence team, has uncovered an ongoing industrial cyberespionage campaign targeting hundreds of manufacturing and other industrial firms primarily located in South Korea.</p> <p>The campaign steals passwords and documents which could be used in a number of ways, including stealing trade secrets and intellectual property, performing cyber reconnaissance for future attacks, and compromising industrial control networks for ransomware attacks.</p> <p>For example, the attackers could be stealing proprietary information about industrial equipment designs so they can sell it to competitors and nation-states seeking to advance their competitive posture.</p> <p>Also, credentials can provide attackers with remote RDP access to IoT/ICS networks, while plant schematics help adversaries understand plant layouts in order to facilitate attacks. Design information can also be used by cyberattackers to identify vulnerabilities in industrial control systems.</p>
Observed	Sectors: Engineering and Manufacturing. Countries: China, Ecuador, Germany, Indonesia, Japan, South Korea, Thailand, Turkey and UK.
Tools used	LaZagne, MOVEit Freely, NcFTPPut, Secure FTP Client, Separ and Living off the Land.

GCMAN

Names	GCMAN (Kaspersky)
Country	Russia
Motivation	Financial crime
First seen	2016
Description	<p>(Kaspersky) A second group, which we call GCMAN because the malware is based on code compiled on the GCC compiler, emerged recently using similar techniques to the Corkow, Metel Group to infect banking institutions and attempt to transfer money to e-currency services.</p> <p>The initial infection mechanism is handled by spear-phishing financial institution targets with e-mails carrying a malicious RAR archive to. Upon opening the RAR archive, an executable is started instead of a Microsoft Word document, resulting in infection.</p> <p>Once inside the network, the GCMAN group uses legitimate and penetration testing tools such as Putty, VNC, and Meterpreter for lateral movement. Our investigation revealed an attack where the group then planted a cron script into bank's server, sending financial transactions at the rate of \$200 per minute. A time-based scheduler was invoking the script every minute to post new transactions directly to upstream payment processing system. This allowed the group to transfer money to multiple e-currency services without these transactions being reported to any system inside the bank.</p>
Observed	Sectors: Financial. Country: Russia.
Tools used	GCMAN, Meterpreter, PuTTY, VNC and malicious RAR archives.

GhostNet, Snooping Dragon

Names	GhostNet (<i>Information Warfare Monitor</i>) Snooping Dragon (<i>UCAM</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2009	
Description	<p>(Information Warfare Monitor) Cyber espionage is an issue whose time has come. In this second report from the Information Warfare Monitor, we lay out the findings of a 10-month investigation of alleged Chinese cyber spying against Tibetan institutions. The investigation, consisting of fieldwork, technical scouting, and laboratory analysis, discovered a lot more. The investigation ultimately uncovered a network of over 1,295 infected hosts in 103 countries. Up to 30% of the infected hosts are considered high-value targets and include computers located at ministries of foreign affairs, embassies, international organizations, news media, and NGOs. The Tibetan computer systems we manually investigated, and from which our investigations began, were conclusively compromised by multiple infections that gave attackers unprecedented access to potentially sensitive information.</p> <p>(UCAM) Attacks on the Dalai Lama's Private Office The OHHD started to suspect it was under surveillance while setting up meetings between His Holiness and foreign dignitaries. They sent an email invitation on behalf of His Holiness to a foreign diplomat, but before they could follow it up with a courtesy telephone call, the diplomat's office was contacted by the Chinese government and warned not to go ahead with the meeting. The Tibetans wondered whether a computer compromise might be the explanation; they called ONI Asia who called us. (Until May 2008, the first author was employed on a studentship funded by the OpenNet Initiative and the second author was a principal investigator for ONI.)</p> <p>Also see Shadow Network.</p>	
Observed	Sectors: Embassies, Financial, Government, Media and NGOs. 1,295 infected computers in 103 countries, including the Dalai Lama, the ministries of foreign affairs of Bangladesh, Barbados, Bhutan, Brunei, Indonesia, Iran, Latvia and Philippines; embassies of Cyprus, Germany, India, Indonesia, Malta, Pakistan, Portugal, Romania, South Korea, Taiwan and Thailand; the ASEAN (Association of Southeast Asian Nations) Secretariat, SAARC (South Asian Association for Regional Cooperation), and the Asian Development Bank; news organizations; and an unclassified computer located at NATO headquarters.	
Tools used	Gh0stnet, Gh0st RAT and TOM-Skype.	
Counter operations	2010	Taken down by the Shadowserver Foundation.

Gorgon Group

Names	Gorgon Group (<i>Palo Alto</i>) Subaat (<i>Palo Alto</i>) ATK 92 (<i>Thales</i>) TAG-CR5	
Country	Pakistan	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2017	
Description	<p>Gorgon Group is a threat group consisting of members who are suspected to be Pakistan-based or have other connections to Pakistan. The group has performed a mix of criminal and targeted attacks, including campaigns against government organizations in the United Kingdom, Spain, Russia, and the United States.</p> <p>Gorgon Group may be related to Transparent Tribe, APT 36 and may be responsible for the Aggah activity.</p>	
Observed	<p>Sectors: Government. Countries: Russia, Spain, Switzerland, UK and USA.</p>	
Tools used	Crimson RAT, LokiBot, NanoCore RAT, NetWire RC, njRAT, QuasarRAT, RemcosRAT and RevengeRAT.	
Operations performed	Jul 2017	<p>Small wave of phishing emails targeting a US-based government organization.</p> <p>Within the 43 emails we observed, we found that three unique files were delivered, which consisted of two RTFs and a Microsoft Excel file. Both RTFs exploited CVE-2012-0158 and acted as downloaders to ultimately deliver the QuasarRAT malware family. The downloaders made use of the same shellcode, with minor variances witnessed between them. Additionally, the RTFs made use of heavy obfuscation within the documents themselves, making it more difficult to extract the embedded shellcode.</p> <p><https://unit42.paloaltonetworks.com/unit42-tracking-subaat-targeted-phishing-attacks-point-leader-threat-actors-repository/></p>
	Feb 2018	<p>In addition to the numerous targeted attacks, Unit 42 discovered that the group also performed a litany of attacks and operations around the globe, involving both criminal as well as targeted attacks.</p> <p>Starting in February 2018, Palo Alto Networks Unit 42 identified a campaign of attacks performed by members of Gorgon Group targeting governmental organizations in the United Kingdom, Spain, Russia, and the United States. Additionally, during that time, members of Gorgon Group were also performing criminal operations against targets across the globe, often using shared infrastructure with their targeted attack operations.</p> <p><https://unit42.paloaltonetworks.com/unit42-gorgon-group-slithering-nation-state-cybercrime/></p>

Group5

Names	Group5 (<i>Citizen Lab</i>)
Country	Iran
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2015
Description	<p>(SecurityWeek) A threat actor using Iranian-language tools, Iranian hosting companies, operating from the Iranian IP space at times was observed targeting the Syrian opposition in an elaborately staged malware operation, Citizen Lab researchers reveal.</p> <p>The operation was first noticed in late 2015, when a member of the Syrian opposition flagged a suspicious email containing a PowerPoint slideshow, which led researchers to a watering hole website with malicious programs, malicious PowerPoint files, and Android malware.</p> <p>The threat actor was targeting Windows and Android devices of well-connected individuals in the Syrian opposition, researchers discovered. They called the actor Group5, because it targets Syrian opposition after regime-linked malware groups, the Syrian Electronic Army (SEA), Deadeye Jackal, ISIS (also known as the Islamic State or ISIL), and a group linked to Lebanon did the same in the past.</p>
Observed	Countries: Syria.
Tools used	DroidJack, NanoCore RAT and njRAT.
Information	< https://www.securityweek.com/iranian-actor-group5-targeting-syrian-opposition >

Hades

Names	Hades (Kaspersky)	
Country	Russia	
Motivation	Sabotage and destruction, Financial crime	
First seen	2017	
Description	<p>(Kaspersky) In March 2018 we published our research on Olympic Destroyer, an advanced attack that hit organizers, suppliers and partners of the Winter Olympic Games 2018 held in Pyeongchang, South Korea. Olympic Destroyer was a cyber-sabotage attack based on the spread of a destructive network worm. The sabotage stage was preceded by reconnaissance and infiltration into target networks to select the best launchpad for the self-replicating and self-modifying destructive malware.</p> <p>We are calling the actor behind the Olympic Destroyer attack – “Hades”. We have previously emphasized that Hades is different from other threat actors because the whole attack was a masterful operation in deception. Despite that, the attackers made serious mistakes, which helped us to spot and prove the forgery of rare attribution artefacts. The attackers behind Olympic Destroyer forged automatically generated signatures, known as Rich Header, to make it look like the malware was produced by Lazarus Group, Hidden Cobra, Labyrinth Chollima APT, an actor widely believed to be associated with North Korea. If this is new to the reader, we recommend a separate blog dedicated to the analysis of this forgery.</p> <p>Some of the TTPs and operational security used by Hades during the Olympic Destroyer attack bear a certain resemblance to Sofacy, APT 28, Fancy Bear, Sednit APT group activity. When it comes to false flags, mimicking TTPs is much harder than tampering with technical artefacts. It implies a deep knowledge of how the actor being mimicked operates as well as operational adaptation to these new TTPs. However, it is important to remember that Hades can be considered a master in the use of false flags: for now we assess that connection with low to moderate confidence.</p>	
Observed	<p>Sectors: Financial, Government and Healthcare. Countries: Russia, South Korea, Ukraine and Europe.</p>	
Tools used	Brave Prince, Gold Dragon, Olympic Destroyer and RunningRAT.	
Operations performed	Jun 2019	Hades, the actor behind Olympic Destroyer is still alive https://securelist.com/olympic-destroyer-is-still-alive/86169/
	Feb 2020	Operation “TrickyMouse” Attacks pretend to be from the Center for Public Health of the Ministry of Health of Ukraine and deliver bait document containing the latest news regarding #COVID-19. A backdoor written in C# gets dropped by malicious macro code to perform remote control. https://twitter.com/RedDrip7/status/1230683740508000256 https://mp.weixin.qq.com/s/o6KC0k43AuOY5F8FKGbmMg

Hexane

Names	Hexane (<i>Dragos</i>) Lyceum (<i>SecureWorks</i>) ATK 120 (<i>Thales</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2017
Description	(<i>Dragos</i>) Dragos identified a new activity group targeting industrial control systems (ICS) related entities: Hexane. Dragos observed this group targeting oil and gas companies in the Middle East, including Kuwait as a primary operating region. Additionally, and unlike other activity groups Dragos tracks, Hexane also targeted telecommunication providers in the greater Middle East, Central Asia, and Africa, potentially as a stepping stone to network-focused man-in-the-middle and related attacks. The threat actor shows similarities with other groups such as APT 33 , Elfin , Magnallium and OilRig , APT 34 , Helix Kitten , Chrysene , both active since at least 2017 and involved in attacks on oil and gas companies. Anyway, experts pointed out that the Hexane group has differed TTPs and has its own arsenal.
Observed	Sectors: Energy, Oil and gas and Telecommunications. Countries: Kuwait, Middle East, Central Asia and Africa.
Tools used	DanBot, DanDrop, Decrypt-RDCMan.ps1, Get-LAPSP.ps1 and kl.ps1.

Hidden Lynx, Aurora Panda

Names	Hidden Lynx (Symantec) Aurora Panda (CrowdStrike) Group 8 (Talos)	
Country	China	
Motivation	Information theft and espionage	
First seen	2009	
Description	<p>(Symantec) The Hidden Lynx group has been in operation since at least 2009 and is most likely a professional organization that offers a “hackers for hire” service. They have the capability to attack many organizations with concurrently running campaigns. They operate efficiently and move quickly and methodically. Based on these factors, the Hidden Lynx group would need to be a sizeable organization made up of between 50 and 100 individuals.</p> <p>Much of the attack infrastructure and tools used during these campaigns originate from network infrastructure in China. The Hidden Lynx group makes regular use of zero-day exploits and has the ability to rework and customize exploits quickly. They are methodical in their approach and they display a skillset far in advance of some other attack groups also operating in that region, such as the Comment Crew (also known as APT1). The Hidden Lynx group is an advanced persistent threat that has been in operation for at least four years and is breaking into some of the best-protected organizations in the world. With a zero-day attack already under their belt in 2013, they continue to operate at the leading edge of targeted attacks.</p> <p>This group appears to be closely associated with APT 17, Deputy Dog, Elderwood, Sneaky Panda.</p>	
Observed	<p>Sectors: Construction, Defense, Education, Financial, Food and Agriculture, Engineering, Healthcare, IT, Government, Media, Non-profit organizations, Pharmaceutical, Retail and lawyers.</p> <p>Countries: Australia, Canada, China, France, Germany, Hong Kong, India, Japan, Russia, Singapore, South Korea, Taiwan, UK, Ukraine and USA.</p>	
Tools used	BlackCoffee, HiKit, Moudoor and Naid.	
Operations performed	Jun 2012	VOHO campaign The VOHO campaign, first publicized by RSA, is one of the largest and most successful watering-hole attacks to date. The campaign combined both regional and industry-specific attacks and predominantly targeted organizations that operate in the United States. In a rapidly spreading two-phase attack, which started on June 25 and finished July 18, nearly 4,000 machines had downloaded a malicious payload. These payloads were being delivered to unsuspecting victims from legitimate websites that were strategically compromised. <https://www.symantec.com/content/en/us/enterprise/media/security_response/whitepapers/hidden_lynx.pdf>
	Jul 2012	Breach of the Bit9 website https://blog.bit9.com/2013/02/08/bit9-and-our-customers-security/

Hurricane Panda

Names	Hurricane Panda (<i>CrowdStrike</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(<i>CrowdStrike</i>) We have investigated their intrusions since 2013 and have been battling them nonstop over the last year at several large telecommunications and technology companies. The determination of this China-based adversary is truly impressive: they are like a dog with a bone.</p> <p>Hurricane Panda's preferred initial vector of compromise and persistence is a China Chopper webshell – a tiny and easily obfuscated 70 byte text file that consists of an 'eval()' command, which is then used to provide full command execution and file upload/download capabilities to the attackers. This script is typically uploaded to a web server via a SQL injection or WebDAV vulnerability, which is often trivial to uncover in a company with a large external web presence.</p> <p>Once inside, the adversary immediately moves on to execution of a credential theft tool such as Mimikatz (repacked to avoid AV detection). If they are lucky to have caught an administrator who might be logged into that web server at the time, they will have gained domain administrator credentials and can now roam your network at will via 'net use' and 'wmic' commands executed through the webshell terminal.</p>	
Observed	Sectors: Financial, Media, Technology and Telecommunications. Countries: USA and Asia.	
Tools used	China Chopper and Mimikatz.	
Operations performed	Mar 2014	Operation "Poisoned Hurricane" <https://www.fireeye.com/blog/threat-research/2014/08/operation-poisoned-hurricane.html>
Information	 <https://www.crowdstrike.com/blog/cyber-deterrence-in-action-a-story-of-one-long-hurricane-panda-campaign/>	

Icefog, Dagger Panda

Names	Icefog (<i>Kaspersky</i>) Dagger Panda (<i>CrowdStrike</i>) ATK 23 (<i>Thales</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(<i>Kaspersky</i>) "Icefog" is an Advanced Persistent Threat that has been active since at least 2011, targeting mostly Japan and South Korea. Known targets include governmental institutions, military contractors, maritime and shipbuilding groups, telecom operators, industrial and high-tech companies and mass media. The name "Icefog" comes from a string used in the command-and-control server name in one of the samples. The command-and-control software is named "Dagger Three", in the Chinese language.</p> <p>During Icefog attacks, several other malicious tools and backdoors were uploaded to the victims' machines, for data exfiltration and lateral movement.</p> <p>The later group RedAlpha has infrastructure overlap with Icefog.</p>	
Observed	<p>Sectors: Aerospace, Defense, Government, High-Tech, Maritime and Shipbuilding, Media, Telecommunications, Utilities and others.</p> <p>Countries: Australia, Austria, Belarus, Canada, China, France, Germany, Hong Kong, India, Italy, Japan, Kazakhstan, Malaysia, Maldives, Mongolia, Netherlands, Pakistan, Philippines, Russia, Singapore, South Korea, Sri Lanka, Taiwan, Tajikistan, Turkey, UK, USA and Uzbekistan.</p>	
Tools used	Dagger Three, Icefog and Javafog.	
Operations performed	Jan 2014	The Icefog APT Hits US Targets With Java Backdoor Since the publication of our report, the Icefog attackers went completely dark, shutting down all known command-and-control servers. Nevertheless, we continued to monitor the operation by sinkholing domains and analyzing victim connections. During this monitoring, we observed an interesting type of connection which seemed to indicate a Java version of Icefog, further to be referenced as "Javafog". https://securelist.com/the-icefog-apt-hits-us-targets-with-java-backdoor/58209/

Inception Framework, Cloud Atlas

Names	Inception Framework (<i>Symantec</i>) Cloud Atlas (<i>Kaspersky</i>) Oxygen (<i>Microsoft</i>) ATK 116 (<i>Thales</i>) The Rocra
Country	Russia
Motivation	Information theft and espionage
First seen	2012
Description	(<i>Symantec</i>) Researchers from Blue Coat Labs have identified the emergence of a previously undocumented attack framework that is being used to launch highly targeted attacks in order to gain access to, and extract confidential information from, victims' computers. Because of the many layers used in the design of the malware, we've named it Inception—a reference to the 2010 movie "Inception" about a thief who entered peoples' dreams and stole secrets from their subconscious. Targets include individuals in strategic positions: Executives in important businesses such as oil, finance and engineering, military officers, embassy personnel and government officials. The Inception attacks began by focusing on targets primarily located in Russia or related to Russian interests, but have since spread to targets in other locations around the world. The preferred malware delivery method is via phishing emails containing trojanized documents. <ul style="list-style-type: none">• Initially targeted at Russia, but expanding globally• Masterful identity cloaking and diversionary tactics• Clean and elegant code suggesting strong backing and top-tier talent• Includes malware targeting mobile devices: Android, Blackberry and iOS• Using a free cloud hosting service based in Sweden for command and control
Observed	Sectors: Aerospace, Defense, Embassies, Energy, Engineering, Financial, Government, Oil and gas and Research. Countries: Afghanistan, Armenia, Austria, Azerbaijan, Belarus, Belgium, Brazil, Congo, Cyprus, France, Georgia, Germany, Greece, India, Indonesia, Iran, Italy, Jordan, Kazakhstan, Kenya, Kyrgyzstan, Lebanon, Lithuania, Malaysia, Moldova, Morocco, Mozambique, Oman, Pakistan, Paraguay, Portugal, Qatar, Romania, Russia, Saudi Arabia, South Africa, Suriname, Switzerland, Tajikistan, Tanzania, Turkey, Turkmenistan, Uganda, Ukraine, UAE, USA, Uzbekistan, Venezuela and Vietnam.
Tools used	Inception, Lastacloud, PowerShower, VBShower and many 0-day exploits.
Operations performed	Oct 2012 Operation "RedOctober" In October 2012, Kaspersky Lab's Global Research & Analysis Team initiated a new threat research after a series of attacks against computer networks of various international diplomatic service agencies. A large scale cyber-espionage network was revealed and analyzed during the investigation, which we called "Red October" (after famous novel "The Hunt For The Red October"). <https://securelist.com/red-october-diplomatic-cyber-attacks-investigation/36740/#8>
	May 2014 Hiding Behind Proxies Since 2014, Symantec has found evidence of a steady stream of attacks from the Inception Framework targeted at organizations on

		several continents. As time has gone by, the group has become ever more secretive, hiding behind an increasingly complex framework of proxies and cloud services. <https://www.symantec.com/blogs/threat-intelligence/inception-framework-hiding-behind-proxies>
	Aug 2014	Operation “Cloud Atlas” In August 2014, some of our users observed targeted attacks with a variation of CVE-2012-0158 and an unusual set of malware. We did a quick analysis of the malware and it immediately stood out because of certain unusual things that are not very common in the APT world. <https://securelist.com/cloud-atlas-redoctober-apt-is-back-in-style/68083/>
	Oct 2018	This blog describes attacks against European targets observed in October 2018, using CVE-2017-11882 and a new PowerShell backdoor we’re calling POWERSHOWER due to the attention to detail in terms of cleaning up after itself, along with the malware being written in PowerShell. <https://unit42.paloaltonetworks.com/unit42-inception-attackers-target-europe-year-old-office-vulnerability/>
	2019	During its recent campaigns, Cloud Atlas used a new “polymorphic” infection chain relying no more on PowerShower directly after infection, but executing a polymorphic HTA hosted on a remote server, which is used to drop three different files on the local system. <https://securelist.com/recent-cloud-atlas-activity/92016/>

Infy, Prince of Persia

Names	Infy (<i>Palo Alto</i>) Prince of Persia (<i>Palo Alto</i>) Operation Mermaid (<i>Qihoo 360</i>) APT-C-07 (<i>Qihoo 360</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>Since early 2013, we have observed activity from a unique threat actor group, which we began to investigate based on increased activities against human right activists in the beginning of 2015. In line with other research on the campaign, released prior to publication of this document, we have adopted the name “Infy”, which is based on labels used in the infrastructure and its two families of malware agents.</p> <p>Thanks to information we have been able to collect during the course of our research, such as characteristics of the group’s malware and development cycle, our research strongly supports the claim that the Infy group is of Iranian origin and potentially connected to the Iranian state. Amongst a backdrop of other incidents, Infy became one of the most frequently observed agents for attempted malware attacks against Iranian civil society beginning in late 2014, growing in use up to the February 2016 parliamentary election in Iran. After the conclusion of the parliamentary election, the rate of attempted intrusions and new compromises through the Infy agent slowed, but did not end. The trends witnessed in reports from recipients are reinforced through telemetry provided by design failures in more recent versions of the Infy malware.</p>	
Observed	<p>Sectors: Government and private sectors. Countries: Bahrain, Canada, China, Denmark, France, Germany, Iran, Israel, Italy, Russia, Saudi Arabia, Sweden, Syria, UK and USA.</p>	
Tools used	Infy.	
Operations performed	May 2015	In May 2015, Palo Alto Networks WildFire detected two e-mails carrying malicious documents from a genuine and compromised Israeli Gmail account, sent to an Israeli industrial organization. One e-mail carried a Microsoft PowerPoint file named “thanks.pps”, the other a Microsoft Word document named “request.docx”. https://unit42.paloaltonetworks.com/prince-of-persia-infymalware-active-in-decade-of-targeted-attacks/
	Feb 2017	In February 2017, we observed an evolution of the “Infy” malware that we’re calling “Foudre” (“lightning”, in French). The actors appear to have learned from our previous takedown and sinkholing of their Command and Control (C2) infrastructure – Foudre incorporates new anti-takeover techniques in an attempt to avoid their C2 domains being sinkholed as we did in 2016. https://unit42.paloaltonetworks.com/unit42-prince-persia-ride-lightning-infymalware-returns-foudre/

Counter operations	Jun 2016	Prince of Persia – Game Over https://unit42.paloaltonetworks.com/unit42-prince-of-persia-game-over/

IronHusky

Names	IronHusky (<i>Kaspersky</i>) BBCY-TA1 (<i>BlackBerry</i>)
Country	China
Motivation	Information theft and espionage
First seen	2017
Description	(<i>Kaspersky</i>) IronHusky is a Chinese-speaking actor that we first detected in summer 2017. It is very focused on tracking the geopolitical agenda of targets in central Asia with a special focus in Mongolia, which seems to be an unusual target. This actor crafts campaigns for upcoming events of interest. In this case, they prepared and launched one right before a meeting with the International Monetary Fund and the Mongolian government at the end of January 2018. At the same time, they stopped their previous operations targeting Russian military contractors, which speaks volumes about the group's limitations. In this new campaign, they exploited CVE-2017-11882 to spread common RATs typically used by Chinese-speaking groups, such as PlugX and PoisonIvy.
Observed	Sectors: Defense, Financial and Government. Countries: Mongolia and Russia.
Tools used	Poison Ivy and PlugX.

Ke3chang, Vixen Panda, APT 15, GREF, Playful Dragon

Names	Ke3chang (<i>FireEye</i>) Vixen Panda (<i>CrowdStrike</i>) APT 15 (<i>Mandiant</i>) GREF (<i>SecureWorks</i>) Playful Dragon (<i>FireEye</i>) Royal APT (<i>NCC Group</i>) Metushy Social Network Team	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2010	
Description	Ke3chang is a threat group attributed to actors operating out of China. Ke3chang has targeted several industries, including oil, government, military, and more.	
Observed	Sectors: Aerospace, Aviation, Chemical, Defense, Embassies, Energy, Government, High-Tech, Industrial, Manufacturing, Mining, Oil and gas and Utilities and Uyghur communities. Countries: Afghanistan, Belgium, Brazil, Chile, China, Egypt, France, Guatemala, India, Indonesia, Iran, Kazakhstan, Kuwait, Malaysia, Pakistan, Saudi Arabia, Slovakia, Syria, Turkey, UK and Uzbekistan.	
Tools used	BS2005, CarbonSteal, Cobalt Strike, DarthPusher, DoubleAgent, GoldenEagle, HenBox, HighNoon, Ketrican, Ketrum, Mimikatz, MirageFox, MS Exchange Tool, Okrum, PluginPhantom, ProcDump, PsList, RoyalCli, RoyalDNS, SilkBean, spwebmember, SpyWaller, TidePool, Winnti, XSLCmd and Living off the Land.	
Operations performed	2010	Operation “Ke3chang” As the crisis in Syria escalates, FireEye research-ers have discovered a cyber espionage campaign, which we call “Ke3chang,” that falsely advertises information updates about the ongoing crisis to compromise MFA networks in Europe. We believe that the Ke3chang attackers are operating out of China and have been active since at least 2010. However, we believe specific Syria-themed attacks against MFAs (codenamed by Ke3chang as “moviestar”) began only in August 2013. The timing of the attacks precedes a G20 meeting held in Russia that focused on the crisis in Syria. <https://www.fireeye.com/content/dam/fireeye-www/global/en/current-threats/pdfs/wp-operation-ke3chang.pdf>
	Aug 2014	Forced to Adapt: XSLCmd Backdoor Now on OS X <https://www.fireeye.com/blog/threat-research/2014/09/forced-to-adapt-xslcmd-backdoor-now-on-os-x.html>
	2015	The Lookout Threat Intelligence team has discovered four Android surveillanceware tools, which are used to target the Uyghur ethnic minority group. Our research indicates that these four interconnected malware tools are elements of much larger mAPT (mobile advanced persistent threat) campaigns that have been active for years. Although there is evidence that the campaigns have been active since at least 2013, Lookout researchers have been monitoring the surveillanceware

		families — SilkBean, DoubleAgent, CarbonSteal and GoldenEagle — as far back as 2015. <https://www.lookout.com/documents/threat-reports/us/lookout-uyghur-malware-tr-us.pdf>
	May 2016	Little has been published on the threat actors responsible for Operation Ke3chang since the report was released more than two years ago. However, Unit 42 has recently discovered the actors have continued to evolve their custom malware arsenal. We've discovered a new malware family we've named TidePool. It has strong behavioral ties to Ke3chang and is being used in an ongoing attack campaign against Indian embassy personnel worldwide. This targeting is also consistent with previous attacker TPPs; Ke3chang historically targeted the Ministry of Affairs, and also conducted several prior campaigns against India. <https://unit42.paloaltonetworks.com/operation-ke3chang-resurfaces-with-new-tidepool-malware/>
	May 2017	Attack on a company that provides a range of services to UK Government A number of sensitive documents were stolen by the attackers during the incident and we believe APT15 was targeting information related to UK government departments and military technology. During our analysis of the compromise, we identified new backdoors that now appear to be part of APT15's toolset. The backdoor BS2005 – which has traditionally been used by the group – now appears alongside the additional backdoors RoyalCli and RoyalDNS. <https://www.nccgroup.trust/uk/about-us/newsroom-and-events/blogs/2018/march/apt15-is-alive-and-strong-an-analysis-of-royalcli-and-royaldns/>
	Jun 2018	Operation "MirageFox" The malware involved in this recent campaign, MirageFox, looks to be an upgraded version of a tool, a RAT believed to originate in 2012, known as Mirage. <https://www.intezer.com/miragefox-apt15-resurfaces-with-new-tools-based-on-old-ones/>
	Mar 2019	The group continues to be active in 2019 – in March 2019, we detected a new Ketrican sample that has evolved from the 2018 Ketrican backdoor. It attacked the same targets as the backdoor from 2018. <https://www.welivesecurity.com/2019/07/18/okrum-ke3chang-targets-diplomatic-missions/>
	May 2020	In mid May, we identified three recently uploaded samples from VirusTotal that share code with older APT15 implants. We named this new family of samples, "Ketrum", due to the merger of features in the documented backdoor families "Ketrican" and "Okrum". <https://www.intezer.com/blog/research/the-evolution-of-apt15s-codebase-2020/>

Kimsuky, Velvet Chollima

Names	Kimsuky (Kaspersky) Velvet Chollima (CrowdStrike) Thallium (Microsoft) Black Banshee (PWC)	
Country	North Korea	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(Kaspersky) For several months, we have been monitoring an ongoing cyber-espionage campaign against South Korean think-tanks. There are multiple reasons why this campaign is extraordinary in its execution and logistics. It all started one day when we encountered a somewhat unsophisticated spy program that communicated with its "master" via a public e-mail server. This approach is rather inherent to many amateur virus-writers and these malware attacks are mostly ignored.</p>	
Observed	<p>Sectors: Education, Energy, Think Tanks, Ministry of Unification, Sejong Institute and Korea Institute for Defense Analyses. Countries: South Korea and USA.</p>	
Tools used	BabyShark, Gh0st RAT, Grease, KimJongRAT, Kimsuky, KportScan, MailPassView, Mechanical, Mimikatz, MyDogs, Network Password Recovery, ProcDump, PsExec, Remote Desktop PassView, SniffPass, WebBrowserPassView and Living off the Land.	
Operations performed	2013	For several months, we have been monitoring an ongoing cyber-espionage campaign against South Korean think-tanks. https://securelist.com/the-kimsuky-operation-a-north-korean-apt/57915/
	2014	The South Korean government issued a report today blaming North Korea for network intrusions that stole data from Korea Hydro and Nuclear Power (KHNP), the company that operates South Korea's 23 nuclear reactors. While the government report stated that only "non-critical" networks were affected, the attackers had demanded the shutdown of three reactors just after the intrusion. They also threatened "destruction" in a message posted to Twitter. https://arstechnica.com/information-technology/2015/03/south-korea-claims-north-hacked-nuclear-data/

Motivation	Information theft and espionage, Sabotage and destruction, Financial crime
First seen	2007
Description	<p>(Malwarebytes) Lazarus Group is commonly believed to be run by the North Korean government, motivated primarily by financial gain as a method of circumventing long-standing sanctions against the regime. They first came to substantial media notice in 2013 with a series of coordinated attacks against an assortment of South Korean broadcasters and financial institutions using DarkSeoul, a wiper program that overwrites sections of the victims' master boot record.</p> <p>In November 2014, a large scale breach of Sony Pictures was attributed to Lazarus. The attack was notable due to its substantial penetration across Sony networks, the extensive amount of data exfiltrated and leaked, as well of use of a wiper in a possible attempt to erase forensic evidence. Attribution on the attacks was largely hazy, but the FBI released a statement tying the Sony breach to the earlier DarkSeoul attack, and officially attributed both incidents to North Korea.</p> <p>Fast forward to May 2017 with the widespread outbreak of WannaCry, a piece of ransomware that used an SMB exploit as an attack vector. Attribution to North Korea rested largely on code reuse between WannaCry and previous North Korean attacks, but this was considered to be thin grounds given the common practice of tool sharing between regional threat groups. Western intelligence agencies released official statements to the public reaffirming the attribution, and on September 6, 2018, the US Department of Justice charged a North Korean national with involvement in both WannaCry and the Sony breach.</p> <p>Lazarus Group has 2 subgroups:</p> <ol style="list-style-type: none">1. Subgroup: Andariel, Silent Chollima2. Subgroup: Bluenoroff, APT 38, Stardust Chollima <p>The following groups may be associated with the Lazarus Group: Covellite, Reaper, APT 37, Ricochet Chollima, ScarCruft and Wassonite.</p>

Operations performed	2007 Operation "Flame" Target: South Korean government. Method: Disruption and sabotage.
	Jul 2009 Operation "Troy" North Korean hackers are suspected of launching a cyber-attack on some of the most important government offices in the US and South Korea in recent days, including the White House, the Pentagon, the New York Stock Exchange and the presidential Blue House in Seoul. The attack took out some of South Korea's most important websites, including those of the Blue House, the defense ministry, the national assembly, Shinhan bank, Korea Exchange bank and the top internet portal Naver. Target: Government, financial and media institutions in South Korea and USA. Method: DDoS attacks. < https://www.theguardian.com/world/2009/jul/08/south-korea-cyber-attack >
	Mar 2011 Attack on South Korean banks and media Recent Distributed Denial of Service (DDoS) attacks on a number of South Korean websites have been in news for the past week. The threat responsible for carrying out these attacks is Trojan.Koredos. Target: South Korean organizations. Method: DDoS attacks and destruction of infected machines. < https://www.symantec.com/connect/blogs/trojankoredos-comes-unwelcomed-surprise >
	Mar 2013 Operation "Ten Days of Rain" / "DarkSeoul" Computer networks running three major South Korean banks and the country's two largest broadcasters were paralyzed Wednesday in attacks that some experts suspected originated in North Korea, which has consistently threatened to cripple its far richer neighbor.

	<p>The attacks, which left many South Koreans unable to withdraw money from A.T.M.'s and news broadcasting crews staring at blank computer screens, came as the North's official Korean Central News Agency quoted the country's leader, Kim Jong-un, as threatening to destroy government installations in the South, along with American bases in the Pacific.</p> <p>Target: Three broadcasting stations and a bank in South Korea. Method: Infecting with viruses, stealing and wiping information. <https://www.nytimes.com/2013/03/21/world/asia/south-korea-computer-network-crashes.html></p>
May 2013	<p>South Korean Financial Companies Targeted by Castov</p> <p>In the past few months we have been actively monitoring an exploit kit, called Gongda, which is mainly targeting South Korea. Interestingly, we have come across a piece of malware, known as Castov, being delivered by this exploit kit that targets specific South Korean financial companies and their customers. The cybercriminals in this case have done their research on the South Korean online financial landscape.</p> <p><https://www.symantec.com/connect/blogs/south-korean-financial-companies-targeted-castov></p>
Jun 2013	<p>DarkSeoul Cyberattacks Against South Korea Continue on Anniversary of Korean War</p> <p>Yesterday, June 25, the Korean peninsula observed a series of cyberattacks coinciding with the 63rd anniversary of the start of the Korean War. While multiple attacks were conducted by multiple perpetrators, one of the distributed denial-of-service (DDoS) attacks observed yesterday against South Korean government websites can be directly linked to the DarkSeoul gang and Trojan.Castov.</p> <p><https://www.symantec.com/connect/blogs/four-years-darkseoul-cyberattacks-against-south-korea-continue-anniversary-korean-war></p>
Nov 2014	<p>Operation "Blockbuster": Breach of Sony Pictures Entertainment</p> <p>The attack on Sony Pictures became public knowledge on November 24, 2014, when Sony employees turned on their computers to be greeted with the sight of a neon red skeleton and the words "Hacked by GOP", which stood for "Guardians of the Peace". The message also threatened to release data later that day if an unspecified request was not met. Over the following weeks, huge swathes of information stolen from Sony were released, including: personal information about employees and their families; email correspondence between employees at the company; information about company salaries, unreleased Sony films, and other information.</p> <p>Target: Sony Pictures Entertainment (released the "Interview" movie, ridiculing the North Korean leader).</p> <p>Method: Infecting with malware, stealing and wiping data of the company's employees, correspondence, copies of unreleased films.</p> <p><https://www.trendmicro.com/vinfo/us/security/news/cyber-attacks/the-hack-of-sony-pictures-what-you-need-to-know></p> <p><https://www.operationblockbuster.com/wp-content/uploads/2016/02/Operation-Blockbuster-Report.pdf></p>
Jun 2015	<p>Using the Palo Alto Networks AutoFocus threat intelligence platform, we identified several samples of malicious code with behavior similar to the aforementioned Operation Troy campaign dating back to June 2015, over two years after the original attacks in South Korea. Session</p>

		<p>data revealed a live attack targeting the transportation and logistics sector in Europe.</p> <p><https://unit42.paloaltonetworks.com/tdrop2-attacks-suggest-dark-seoul-attackers-return/></p>
	Mar 2017	<p>The Blockbuster Sequel</p> <p>This recently identified activity is targeting Korean speaking individuals, while the threat actors behind the attack likely speak both Korean and English. This blog will detail the recently discovered samples, their functionality, and their ties to the threat group behind Operation Blockbuster.</p> <p><https://unit42.paloaltonetworks.com/unit42-the-blockbuster-sequel/></p>

Aug 2018	Operation “AppleJeus” Target: Cryptocurrency exchange. Method: Fake installer and macOS malware. < https://securelist.com/operation-applejeus/87553/ >	
Summer 2018	Our investigation into the Dtrack RAT actually began with a different activity. In the late summer of 2018, we discovered ATMDtrack, a piece of banking malware targeting Indian banks. Further analysis showed that the malware was designed to be planted on the victim's ATMs, where it could read and store the data of cards that were inserted into the machines. < https://securelist.com/my-name-is-dtrack/93338/ >	
Oct 2018	Operation “Sharpshooter” Target: 87 organizations in many different sectors (majority Government and Defense) across the globe, predominantly in the United States. Method: Rising Sun implant to gather intelligence. < https://securingtomorrow.mcafee.com/other-blogs/mcafee-labs/operation-sharpshooter-targets-global-defense-critical-infrastructure/ >	
Nov 2018	More Attacks on Cryptocurrency Businesses Target: Some of the documents (for instance one entitled “sample document for business plan evaluation of venture company”) were prepared in Korean, presumably to target South Korean businesses. Another contains a business overview of what seems to be a Chinese technology consulting group named LAFIZ (“we couldn’t confirm if it’s a legitimate business or another fake company made up by Lazarus,” Kaspersky Lab researchers said). Yet another provided information for coin listings with a translation in Korean, researchers said. Method: Documents containing weaponized macros, “carefully prepared to attract the attention of cryptocurrency professionals.” It utilizes PowerShell to control Windows systems and macOS malware for Apple users. < https://securelist.com/cryptocurrency-businesses-still-being-targeted-by-lazarus/90019/ >	
Mar 2019	The infamous Lazarus threat actor group has been found targeting an Israeli defense company, according to new research outlined by a cybersecurity firm ClearSky. The campaign is carried out with an intention to steal military and commercial secrets. < https://cyware.com/news/lazarus-hacking-group-expand-their-attack-horizon-by-targeting-an-israeli-defense-company-02e2ec77 >	
Mar 2019	Operation “AppleJeus sequel” As a result of our ongoing efforts, we identified significant changes to the group's attack methodology. < https://securelist.com/operation-applejeus-sequel/95596/ >	
Apr 2019	“Hoplight” Malware Campaign	

		Known as “Hoplight,” the malware is a collection of nine files, though most of those are designed to work as obfuscation layers to keep admins and security software from spotting the attack. https://www.theregister.co.uk/2019/04/10/lazarus_group_malware/
	May 2019	North Korean Tunneling Tool: ELECTRICFISH This report provides analysis of one malicious 32-bit Windows executable file. The malware implements a custom protocol that allows traffic to be funneled between a source and a destination Internet Protocol (IP) address. The malware continuously attempts to reach out to the source and the designation system, which allows either side to initiate a funneling session. The malware can be configured with a proxy server/port and proxy username and password. This feature allows connectivity to a system sitting inside of a proxy server, which allows the actor to bypass the compromised system's required authentication to reach outside of the network. https://www.us-cert.gov/ncas/analysis-reports/AR19-129A
	May 2019	Hackers associated with the APT Lazarus/HIDDEN COBRA group were found to be breaking into online stores of large US retailers and planting payment skimmers as early as May 2019. https://sansec.io/research/north-korea-magecart
	Sep 2019	Operation “In(ter)caption” At the end of last year, we discovered targeted attacks against aerospace and military companies in Europe and the Middle East, active from September to December 2019. A collaborative investigation with two of the affected European companies allowed us to gain insight into the operation and uncover previously undocumented malware. https://www.welivesecurity.com/wp-content/uploads/2020/06/ESET_Operation_Interception.pdf

Motivation	Financial crime
First seen	2014
Description	A subgroup of Lazarus Group , Hidden Cobra , Labyrinth Chollima . (Kaspersky) The Lazarus Group, a nation-state level of attacker tied to the 2014 attacks on Sony Pictures Entertainment, has splintered off a portion of its operation to concentrate on stealing money to fund itself. The group, widely believed to be North Korean, has been linked to a February 2016 attack against the Bangladesh Central bank that resulted in more than \$850 million in fraudulent SWIFT network transactions, \$80 million of which still has not been recovered.
Operations performed	Oct 2015 Duuzer backdoor Trojan targets South Korea to take over computers Symantec has found that South Korea is being impacted by an active back door Trojan, detected as Backdoor.Duuzer. While the malware attack has not been exclusively targeting the region, it has been focusing on the South Korean manufacturing industry. Duuzer is a well-designed threat that gives attackers remote access to the compromised computer, downloads additional files, and steals data. It's clearly the work of skilled attackers looking to obtain valuable information. <https://www.symantec.com/connect/blogs/duuzer-back-door-trojan-targets-south-korea-take-over-computers>

Lead

Names	Lead (<i>Microsoft</i>) TG-3279 (<i>SecureWorks</i>) Casper (<i>BlackBerry</i>)
Country	China
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2016
Description	<p>(Microsoft) In the past few years, Lead's victims have included:</p> <ul style="list-style-type: none">• Multinational, multi-industry companies involved in the manufacture of textiles, chemicals, and electronics• Pharmaceutical companies• A company in the chemical industry• University faculty specializing in aeronautical engineering and research• A company involved in the design and manufacture of motor vehicles• A cybersecurity company focusing on protecting industrial control systems <p>During these intrusions, Lead's objective was to steal sensitive data, including research materials, process documents, and project plans. Lead also steals code-signing certificates to sign its malware in subsequent attacks.</p> <p>In most cases, Lead's attacks do not feature any advanced exploit techniques. The group also does not make special effort to cultivate victims prior to an attack. Instead, the group often simply emails a Winnti installer to potential victims, relying on basic social engineering tactics to convince recipients to run the attached malware. In some other cases, Lead gains access to a target by brute-forcing remote access login credentials, performing SQL injection, or exploiting unpatched web servers, and then they copy the Winnti installer directly to compromised machines.</p>
Observed	Sectors: Online video game companies, Pharmaceutical, Technology and Telecommunications. Countries: Japan and USA.
Tool used	Cobalt Strike and Winnti.
Information	< https://www.microsoft.com/security/blog/2017/01/25/detecting-threat-actors-in-recent-german-industrial-attacks-with-windows-defender-atp/ >

Leafminer, Raspire, Flash Kitten

Names	Leafminer (<i>Symantec</i>) Raspire (<i>Dragos</i>) Flash Kitten (<i>CrowdStrike</i>)
Country	Iran
Motivation	Information theft and espionage
First seen	2017
Description	<p>(<i>Symantec</i>) Symantec has uncovered the operations of a threat actor named Leafminer that is targeting a broad list of government organizations and business verticals in various regions in the Middle East since at least early 2017. The group tends to adapt publicly available techniques and tools for their attacks and experiments with published proof-of-concept exploits. Leafminer attempts to infiltrate target networks through various means of intrusion: watering hole websites, vulnerability scans of network services on the internet, and brute-force/dictionary login attempts. The actor's post-compromise toolkit suggests that the group is looking for email data, files, and database servers on compromised target systems.</p> <p>(<i>Dragos</i>) Analysis of Raspire tactics, techniques, and procedures (TTPs) indicate the group has been active in some form since early- to mid-2017. Raspire targeting includes entities in the US, Middle East, Europe, and East Asia. Operations against electric utility organizations appear limited to the US at this time.</p> <p>Raspire leverages strategic website compromise to gain initial access to target networks. Raspire uses the same methodology as Berserk Bear, Dragonfly 2.0 and Allanite in embedding a link to a resource to prompt an SMB connection, from which it harvests Windows credentials. The group then deploys install scripts for a malicious service to beacon back to Raspire –controlled infrastructure, allowing the adversary to remotely access the victim machine.</p>
Observed	Sectors: Energy, Financial, Government and Transportation. Countries: Europe, East Asia, Israel, Kuwait, Lebanon and USA.
Tools used	Imecab, LaZagne, Mimikatz, PhpSpy and Sorgu.
Information	< https://www.symantec.com/blogs/threat-intelligence/leafminer-espionage-middle-east > < https://dragos.com/resource/raspire/ >

Leviathan, APT 40, TEMP.Periscope

Names	Leviathan (<i>CrowdStrike</i>) APT 40 (<i>Mandiant</i>) TEMP.Periscope (<i>FireEye</i>) TEMP.Jumper (<i>FireEye</i>) Bronze Mohawk (<i>SecureWorks</i>) Mudcarp (<i>iDefense</i>) Gadolinium (<i>Microsoft</i>) ATK 29 (<i>Thales</i>)	
Country	China	
Sponsor	State-sponsored, Hainan province	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(<i>FireEye</i>) FireEye is highlighting a cyber espionage operation targeting crucial technologies and traditional intelligence targets from a China-nexus state sponsored actor we call APT40. The actor has conducted operations since at least 2013 in support of China's naval modernization effort. The group has specifically targeted engineering, transportation, and the defense industry, especially where these sectors overlap with maritime technologies. More recently, we have also observed specific targeting of countries strategically important to the Belt and Road Initiative including Cambodia, Belgium, Germany, Hong Kong, Philippines, Malaysia, Norway, Saudi Arabia, Switzerland, the United States, and the United Kingdom. This China-nexus cyber espionage group was previously reported as TEMP.Periscope and TEMP.Jumper.</p>	
Observed	<p>Sectors: Defense, Engineering, Government, Manufacturing, Research, Shipping and Logistics, Transportation and other Maritime-related targets across multiple verticals. Countries: Belgium, Cambodia, Germany, Hong Kong, Malaysia, Norway, Philippines, Saudi Arabia, Switzerland, USA, UK, and Asia Pacific Economic Cooperation (APEC).</p>	
Tools used	AIRBREAK, BADFLICK, BlackCoffee, China Chopper, Cobalt Strike, DADJOKE, Dadstache, Derusbi, Gh0st RAT, GRILLMARK, HOMEFRY, LUNCHMONEY, MURKYTOP, NanHaiShu, Orz, PlugX, scanbox, SeDLL, Windows Credentials Editor, ZXShell and Living off the Land.	
Operations performed	2014	<p>Spear-phishing maritime and defense targets Proofpoint researchers are tracking an espionage actor targeting organizations and high-value targets in defense and government. Active since at least 2014, this actor has long-standing interest in maritime industries, naval defense contractors, and associated research institutions in the United States and Western Europe.</p> <p><https://www.proofpoint.com/us/threat-insight/post/leviathan-espionage-actor-spearphishes-maritime-and-defense-targets></p>
	May 2017	<p>Targeting UK-Based Engineering Company Using Russian APT Techniques Employees of a U.K.-based engineering company were among the targeted victims of a spear-phishing campaign in early July 2018. The campaign also targeted an email address possibly belonging to a freelance journalist based in Cambodia who covers Cambodian</p>

		<p>politics, human rights, and Chinese development. We believe both attacks used the same infrastructure as a reported campaign by Chinese threat actor TEMP.Periscope (also known as Leviathan), which targeted Cambodian entities in the run-up to their July 2018 elections. Crucially, TEMP.Periscope's interest in the U.K. engineering company they targeted dates back to attempted intrusions in May 2017.</p> <p><https://www.recordedfuture.com/chinese-threat-actor-tempperiscope/></p>
	2017	<p>The current campaign is a sharp escalation of detected activity since summer 2017. Like multiple other Chinese cyber espionage actors, TEMP.Periscope has recently re-emerged and has been observed conducting operations with a revised toolkit. Known targets of this group have been involved in the maritime industry, as well as engineering-focused entities, and include research institutes, academic organizations, and private firms in the United States.</p> <p><https://www.fireeye.com/blog/threat-research/2018/03/suspected-chinese-espionage-group-targeting-maritime-and-engineering-industries.html></p>
	Jul 2018	<p>Targeting Cambodia Ahead of July 2018 Elections</p> <p>FireEye has examined a range of TEMP.Periscope activity revealing extensive interest in Cambodia's politics, with active compromises of multiple Cambodian entities related to the country's electoral system. This includes compromises of Cambodian government entities charged with overseeing the elections, as well as the targeting of opposition figures. This campaign occurs in the run up to the country's July 29, 2018, general elections.</p> <p><https://www.fireeye.com/blog/threat-research/2018/07/chinese-espionage-group-targets-cambodia-ahead-of-elections.html></p>
	Jan 2020	<p>The Malaysian Computer Emergency Response Team, a government-backed organization, said it had "observed an increase in [the] number of artifacts and victims involving a campaign against Malaysian government officials."</p> <p><https://www.zdnet.com/article/malaysia-warns-of-chinese-hacking-campaign-targeting-government-projects/></p>

Libyan Scorpions

Names	Libyan Scorpions (Cyberkov)
Country	Libya
Motivation	Information theft and espionage
First seen	2015
Description	<p>(Cyberkov) In the past weeks on 6 August 2016, Cyberkov Security Incident Response Team (CSIRT) received a numerous Android malwares operating in different areas in Libya especially in Tripoli and Benghazi.</p> <p>The malware spreads very fast using Telegram messenger application in smartphones, targeting high-profile Libyan influential and political figures.</p> <p>The malware first discovery was after a highly Libyan influential Telegram account compromised via webTelegram using IP address from Spain.</p> <p>Analysis of this incident led us to believe that this operation and the group behind it which we call Libyan Scorpions is a malware operation in use since September 2015 and operated by a politically motivated group whose main objective is intelligence gathering, spying on influentials and political figures and operate an espionage campaign within Libya.</p> <p>Also, the analysis of the incident led to the discovery of multiple malwares targeting Android and Windows machines.</p> <p>Libyan Scorpions threat actors used a set of methods to hide and operate their malwares. They appear not to have highly technical skills but a good social engineering and phishing tricks. The threat actors are not particularly sophisticated, but it is well-understood that such attacks don't need to be sophisticated in order to be effective.</p>
Observed	Sectors: Influencers and political figures. Countries: Libya.
Tools used	Voice Massege.apk and Benghazi.exe
Information	< https://cyberkov.com/wp-content/uploads/2016/09/Hunting-Libyan-Scorpions-EN.pdf >

Longhorn, The Lamberts

Names	Longhorn (<i>Symantec</i>) The Lamberts (<i>Kaspersky</i>) APT-C-39 (<i>Qihoo 360</i>)
Country	USA
Sponsor	State-sponsored, CIA
Motivation	Information theft and espionage
First seen	2009
Description	<p>Some operations and tooling used by this group were exposed in the [Vault 7/8] leaks on WikiLeaks in 2017.</p> <p>(<i>Symantec</i>) Longhorn has been active since at least 2011. It has used a range of back door Trojans in addition to zero-day vulnerabilities to compromise its targets. Longhorn has infiltrated governments and internationally operating organizations, in addition to targets in the financial, telecoms, energy, aerospace, information technology, education, and natural resources sectors. All of the organizations targeted would be of interest to a nation-state attacker.</p> <p>Longhorn has infected 40 targets in at least 16 countries across the Middle East, Europe, Asia, and Africa. On one occasion a computer in the United States was compromised but, following infection, an uninstaller was launched within hours, which may indicate this victim was infected unintentionally.</p> <p>Longhorn's malware appears to be specifically built for espionage-type operations, with detailed system fingerprinting, discovery, and exfiltration capabilities. The malware uses a high degree of operational security, communicating externally at only select times, with upload limits on exfiltrated data, and randomization of communication intervals—all attempts to stay under the radar during intrusions.</p> <p>For C&C servers, Longhorn typically configures a specific domain and IP address combination per target. The domains appear to be registered by the attackers; however they use privacy services to hide their real identity. The IP addresses are typically owned by legitimate companies offering virtual private server (VPS) or webhosting services. The malware communicates with C&C servers over HTTPS using a custom underlying cryptographic protocol to protect communications from identification.</p>
Observed	<p>Sectors: Aerospace, Aviation, Education, Energy, Financial, Government, IT, Oil and gas, Research and Telecommunications.</p> <p>Countries: China and 16 countries in the Middle East, Europe, Asia and Africa.</p>
Tools used	Black Lambert, Blue Lambert, Corentry, Cyan Lambert, Gray Lambert, Green Lambert, Lambert, Magenta Lambert, Pink Lambert, Silver Lambert, Violet Lambert, White Lambert and everything in the [Vault 7/8] archives.

LookBack, TA410

Names	LookBack (<i>Proofpoint</i>) TA410 (<i>Proofpoint</i>)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2019	
Description	<p>(<i>Proofpoint</i>) Between July 19 and July 25, 2019, several spear phishing emails were identified targeting three US companies in the utilities sector. The phishing emails appeared to impersonate a US-based engineering licensing board with emails originating from what appears to be an actor-controlled domain, nceess[.]com. Nceess[.]com is believed to be an impersonation of a domain owned by the US National Council of Examiners for Engineering and Surveying. The emails contain a malicious Microsoft Word attachment that uses macros to install and run malware that Proofpoint researchers have dubbed "LookBack." This malware consists of a remote access Trojan (RAT) module and a proxy mechanism used for command and control (C&C) communication. We believe this may be the work of a state-sponsored APT actor based on overlaps with historical campaigns and macros utilized. The utilization of this distinct delivery methodology coupled with unique LookBack malware highlights the continuing threats posed by sophisticated adversaries to utilities systems and critical infrastructure providers.</p> <p>Proofpoint found similarities in malware delivery with Stone Panda, APT 10, menuPass, but those may have been false flags.</p>	
Observed	Sectors: Energy and Utilities. Countries: USA.	
Tools used	FlowCloud, GUP Proxy Tool, SodomMain and SodomNormal.	
Operations performed	Jul 2019	At the same time as the LookBack campaigns, Proofpoint researchers identified a new, additional malware family named FlowCloud that was also being delivered to U.S. utilities providers. <https://www.proofpoint.com/us/blog/threat-insight/ta410-group-behind-lookback-attacks-against-us-utilities-sector-returns-new>
	Aug 2019	LookBack Forges Ahead: Continued Targeting of the United States' Utilities Sector Reveals Additional Adversary TTPs <https://www.proofpoint.com/us/threat-insight/post/lookback-forges-ahead-continued-targeting-united-states-utilities-sector-reveals>
Information	<https://www.proofpoint.com/us/threat-insight/post/lookback-malware-targets-united-states-utilities-sector-phishing-attacks>	

Lotus Blossom, Spring Dragon, Thrip

Names	Lotus Blossom (<i>Palo Alto</i>) Spring Dragon (<i>Kaspersky</i>) Dragonfish (<i>iDefense</i>) Billbug (<i>Symantec</i>) Thrip (<i>Symantec</i>) ATK 1 (<i>Thales</i>) ATK 78 (<i>Thales</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2012	
Description	<p>(Kaspersky) Spring Dragon is a long running APT actor that operates on a massive scale. The group has been running campaigns, mostly in countries and territories around the South China Sea, since as early as 2012. The main targets of Spring Dragon attacks are high profile governmental organizations and political parties, education institutions such as universities, as well as companies from the telecommunications sector.</p> <p>Spring Dragon is known for spear phishing and watering hole techniques and some of its tools have previously been analyzed and reported on by security researchers, including Kaspersky Lab.</p> <p>Operation Poisoned News, TwoSail Junk may be one of their campaigns.</p>	
Observed	<p>Sectors: Aerospace, Defense, Education, Government, High-Tech, Satellites and Telecommunications.</p> <p>Countries: ASEAN, Brunei, Cambodia, Hong Kong, Indonesia, Japan, Laos, Macao, Malaysia, Myanmar, Philippines, Singapore, Taiwan, Thailand, USA and Vietnam.</p>	
Tools used	Catchamas, Elise, Emissary, gpresult, Hannotog, Mimikatz, PsExec, Rikamanu, Sagerunex, Spedear, WMI Ghost and Living off the Land.	
Operations performed	Jun 2015	Operation “Lotus Blossom” Today Unit 42 published new research identifying a persistent cyber espionage campaign targeting government and military organizations in Southeast Asia. The adversary group responsible for the campaign, which we named “Lotus Blossom,” is well organized and likely state-sponsored, with support from a country that has interests in Southeast Asia. The campaign has been in operation for some time; we have identified over 50 different attacks taking place over the past three years. https://unit42.paloaltonetworks.com/operation-lotus-blossom/
	Nov 2015	Attack on French Diplomat We observed a targeted attack in November directed at an individual working for the French Ministry of Foreign Affairs. The attack involved a spear-phishing email sent to a single French diplomat based in Taipei, Taiwan and contained an invitation to a Science and Technology support group event.

		< https://unit42.paloaltonetworks.com/attack-on-french-diplomat-linked-to-operation-lotus-blossom/ >
	Early 2017	<p>In the beginning of 2017, Kaspersky Lab became aware of new activities by an APT actor we have been tracking for several years called Spring Dragon (also known as LotusBlossom). Information about the new attacks arrived from a research partner in Taiwan and we decided to review the actor's tools, techniques and activities.</p> <p>Using Kaspersky Lab telemetry data we detected the malware in attacks against some high-profile organizations around the South China Sea.</p> <p><https://securelist.com/spring-dragon-updated-activity/79067/></p>
	Jan 2018	<p>Attacks on Association of South East Asian Nations (ASEAN) countries</p> <p>During the last weeks of January (2018), nation state actors from Lotus Blossom conducted a targeted malware spam campaign against the Association of South East Asian Nations (ASEAN) countries.</p> <p><https://community.rsa.com/community/products/netwitness/blog/2018/02/13/lotus-blossom-continues-asean-targeting></p> <p><https://www.accenture.com/t20180127T003755Z_w_us-en_acnmedia/PDF-46/Accenture-Security-Dragonfish-Threat-Analysis.pdf></p>
	Jan 2018	<p>Back in January 2018, TAA triggered an alert at a large telecoms operator in Southeast Asia.</p> <p><https://www.symantec.com/blogs/threat-intelligence/thrip-hits-satellite-telecoms-defense-targets></p>
	Jun 2018	<p>Since Symantec first exposed the Thrip group in 2018, the stealthy China-based espionage group has continued to mount attacks in South East Asia, hitting military organizations, satellite communications operators, and a diverse range of other targets in the region.</p> <p><https://www.symantec.com/blogs/threat-intelligence/thrip-apt-south-east-asia></p>
MITRE ATT&CK		< https://attack.mitre.org/groups/G0030/ > < https://attack.mitre.org/groups/G0076/ >

Lucky Cat

Names	Lucky Cat (Symantec)
Country	China
Motivation	Information theft and espionage
First seen	2011
Description	<p>(Symantec) A series of attacks, targeting both Indian military research and south Asian shipping organizations, demonstrate the minimum level of effort required to successfully compromise a target and steal sensitive information. The attackers use very simple malware, which required little development time or skills, in conjunction with freely available Web hosting, to implement a highly effective attack. It is a case of the attackers obtaining a maximum return on their investment. The attack shows how an intelligent attacker does not need to be particularly technically skilled in order to steal the information they are after. The attack begins, as is often the case, with an email sent to the victim. A malicious document is attached to the email, which, when loaded, activates the malware. The attackers use tailored emails to encourage the victim to open the email. For example, one email sent to an academic claimed to be a call for papers for a conference (CFP).</p> <p>The vast majority of the victims were based in India, with some in Malaysia. The victim industry was mostly military research and also shipping based in the Arabian and South China seas. In some instances the attackers appeared to have a clear goal, whereby specific files were retrieved from certain compromised computers. In other cases, the attackers used more of a 'shotgun' like approach, copying every file from a computer. Military technologies were obviously the focus of one particular attack with what appeared to be source code stolen. 45 different attacker IP addresses were observed. Out of those, 43 were within the same IP address range based in Sichuan province, China. The remaining two were based in South Korea. The pattern of attacker connections implies that the IP addresses are being used as a VPN, probably in an attempt to render the attackers anonymous.</p> <p>The attacks have been active from at least April 2011 up to February 2012. The attackers are intelligent and focused, employing the minimum amount of work necessary for the maximum gain. They do not use zero day exploits or complicated threats, instead they rely on effective social engineering and lax security measures on the part of the victims.</p>
Observed	Sectors: Aerospace, Defense, Engineering, Shipping and Logistics and Tibetan activists. Countries: India, Japan, Malaysia and Tibet.
Tools used	Comfoo, Lucky Cat, Sojax and WMI Ghost.

Lurk

Names	Lurk (Kaspersky)	
Country	Russia	
Motivation	Financial crime	
First seen	2011	
Description	<p>(Kaspersky) When we first encountered Lurk, in 2011, it was a nameless Trojan. It all started when we became aware of a number of incidents at several Russian banks that had resulted in the theft of large sums of money from customers. To steal the money, the unknown criminals used a hidden malicious program that was able to interact automatically with the financial institution's remote banking service (RBS) software; replacing bank details in payment orders generated by an accountant at the attacked organization, or even generating such orders by itself.</p> <p>In 2016, it is hard to imagine banking software that does not demand some form of additional authentication, but things were different back in 2011. In most cases, the attackers only had to infect the computer on which the RBS software was installed in order to start stealing the cash. Russia's banking system, like those of many other countries, was unprepared for such attacks, and cybercriminals were quick to exploit the security gap.</p> <p>So we decided to take a closer look at the malware. The first attempts to understand how the program worked gave our analysts nothing. Regardless of whether it was launched on a virtual or a real machine, it behaved in the same way: it didn't do anything. This is how the program, and later the group behind it, got its name. To "lurk" means to hide, generally with the intention of ambush.</p> <p>We were soon able to help investigate another incident involving Lurk. This time we got a chance to explore the image of the attacked computer. There, in addition to the familiar malicious program, we found a .dll file with which the main executable file could interact. This was our first piece of evidence that Lurk had a modular structure.</p> <p>Later discoveries suggest that, in 2011, Lurk was still at an early stage of development. It was formed of just two components, a number that would grow considerably over the coming years.</p>	
Observed	Sectors: Financial and Media. Countries: Russia.

Madi

Names	Madi (<i>Kaspersky</i>) Mahdi (<i>Kaspersky</i>)	
Country	Iran	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(Kaspersky) Kaspersky Lab and Seculert worked together to sinkhole the Madi Command & Control (C&C) servers to monitor the campaign. Kaspersky Lab and Seculert identified more than 800 victims located in Iran, Israel and select countries across the globe connecting to the C&Cs over the past eight months. Statistics from the sinkhole revealed that the victims were primarily business people working on Iranian and Israeli critical infrastructure projects, Israeli financial institutions, Middle Eastern engineering students, and various government agencies communicating in the Middle East.</p> <p>Common applications and websites that were spied on include accounts on Gmail, Hotmail, Yahoo! Mail, ICQ, Skype, Google+, and Facebook. Surveillance is also performed over integrated ERP/CRM systems, business contracts, and financial management systems.</p>	
Observed	<p>Sectors: Education, Engineering, Financial, Government, Oil and gas and Think Tanks. Countries: Australia, Ecuador, Greece, Iran, Iraq, Israel, Mozambique, New Zealand, Pakistan, Saudi Arabia, Switzerland, USA and Vietnam.</p>	
Tools used	Madi.	
Operations performed	Jul 2012	New and Improved Madi Spyware Campaign Continues Madi, the religiously-titled spyware that was discovered last week and thought to be dead, appears to be making a comeback, complete with updates. < https://threatpost.com/new-and-improved-madi-spyware-campaign-continues-072512/76849/ >
Counter operations		The C&C servers have been sinkholed by Kaspersky and Seculert.

Magic Hound, APT 35, Cobalt Gypsy, Charming Kitten

Names	Magic Hound (<i>Palo Alto</i>) APT 35 (<i>Mandiant</i>) Cobalt Gypsy (<i>SecureWorks</i>) Charming Kitten (<i>CrowdStrike</i>) TEMP.Beanie (<i>FireEye</i>) Timberworm (<i>Symantec</i>) Tarth Andishan (<i>Cylance</i>) TA453 (<i>Proofpoint</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2014	
Description	<p>Magic Hound is an Iranian-sponsored threat group operating primarily in the Middle East that dates back as early as 2014. The group behind the campaign has primarily targeted organizations in the energy, government, and technology sectors that are either based or have business interests in Saudi Arabia.</p> <p>This group appears to be the evolution of Cutting Kitten, TG-2889.</p> <p>There is some infrastructure overlap with Rocket Kitten, Newscaster, NewsBeef.</p>	
Observed	<p>Sectors: Defense, Energy, Financial, Government, Healthcare, IT, Oil and gas, Technology and Telecommunications sectors that are either based or have business interests in Saudi Arabia, and ClearSky, HBO, civil and human rights activists and journalists.</p> <p>Countries: Afghanistan, Canada, Egypt, Iran, Iraq, Israel, Jordan, Kuwait, Morocco, Pakistan, Saudi Arabia, Spain, Syria, Turkey, UAE, UK, Venezuela and Yemen.</p>	
Tools used	CWoolger, DistTrack, DownPaper, FireMalv, Ghambar, Havij, Leash, Matryoshka RAT, Mimikatz, MPKBot, NETWoolger, PsList, PupyRAT, sqlmap and TDTESS.	
Operations performed	Mid-2014	Operation "Thamar Reservoir" This report reviews an ongoing cyber-attack campaign dating back to mid-2014. Additional sources indicate it may date as far back as 2011. We call this campaign Thamar Reservoir, named after one of the targets, Thamar E. Gindin, who exposed new information about the attack and is currently assisting with the investigation. https://www.clearskysec.com/thamar-reservoir/
	2016	Unit 42 has discovered a persistent attack campaign operating primarily in the Middle East dating back to at least mid-2016 which we have named Magic Hound. This appears to be an attack campaign focused on espionage. Based upon our visibility it has primarily targeted organizations in the energy, government, and technology sectors that are either based or have business interests in Saudi Arabia. The adversaries appear to have evolved their tactics and techniques throughout the tracked time-period, iterating through a diverse toolset across different waves of attacks. https://unit42.paloaltonetworks.com/unit42-magic-hound-campaign-attacks-saudi-targets/
	Jan 2017	PupyRAT campaign

		SecureWorks Counter Threat Unit (CTU) researchers analyzed a phishing campaign that targeted a Middle Eastern organization in early January 2017. Some of messages were sent from legitimate email addresses belonging to several Middle Eastern organizations. < https://www.secureworks.com/blog/iranian-pupyrat-bites-middle-eastern-organizations >
2017	The Curious Case of Mia Ash In early 2017, SecureWorks Counter Threat Unit (CTU) researchers observed phishing campaigns targeting several entities in the Middle East and North Africa (MENA), with a focus on Saudi Arabian organizations. The campaigns delivered PupyRAT, an open-source cross-platform remote access Trojan. < https://www.secureworks.com/research/the-curious-case-of-mia-ash >	
Jun 2018	Impersonating ClearSky, the security firm that uncovered its campaigns Iranian cyberespionage group Charming Kitten, which has been operating since 2014, has impersonated the cybersecurity firm that exposed its operations and campaigns. Israeli firm ClearSky Security said the group managed to copy its official website hosted on a similar-looking domain – clearskysecurity[.]net. ClearSky's actual website is Clearskysec.com. < https://cyware.com/news/iranian-apt-charming-kitten-impersonates-clearsky-the-security-firm-that-uncovered-its-campaigns-7fea0b4f >	
Aug 2017	Breach of HBO On August 7 a small treasure trove of HBO content was posted publicly to the web by a hacker who is now demanding a \$6 million payment to stop any further release of data. The hacker who goes by Mr. Smith posted five scripts for Game of Thrones and a month's worth of email from HBO Vice President for Film Programming Leslie Cohen along with some other corporate information, according to the Associated Press. < https://www.scmagazine.com/home/security-news/cybercrime/hbo-breach-accomplished-with-hard-work-by-hacker-poor-security-practices-by-victim/ >	
Oct 2018	The Return of The Charming Kitten In this campaign, hackers have targeted individuals who are involved in economic and military sanctions against the Islamic Republic of Iran as well as politicians, civil and human rights activists and journalists around the world. Our review in Certfa demonstrates that the hackers – knowing that their victims use two-step verification – target verification codes and also their email accounts such as Yahoo! And Gmail. < https://blog.certfa.com/posts/the-return-of-the-charming-kitten/ >	
Jul 2019	In August, the campaign has progressed, and unlike July, it seems like the APT group is now expanding its activities toward influential public figures around the world, rather than academic researchers state organizations. < https://www.clearskysec.com/the-kittens-are-back-in-town/ >	
Aug 2019	In a 30-day period between August and September, the Microsoft Threat Intelligence Center (MSTIC) observed Phosphorus making	

		more than 2,700 attempts to identify consumer email accounts belonging to specific Microsoft customers and then attack 241 of those accounts. < https://blogs.microsoft.com/on-the-issues/2019/10/04/recent-cyberattacks-require-us-all-to-be-vigilant/ > < https://www.clearskysec.com/wp-content/uploads/2019/10/The-Kittens-Are-Back-in-Town-2.pdf >
	Jan 2020	Fake Interview: The New Activity of Charming Kitten < https://blog.certfa.com/posts/fake-interview-the-new-activity-of-charming-kitten/ >

Mikrocean

Names	Mikrocean (ESET) SixLittleMonkeys (Kaspersky)
Country	China
Motivation	Information theft and espionage
First seen	2017
Description	<p>(ESET) In this joint blogpost with fellow researchers from Avast, we provide a technical analysis of a constantly developed RAT that has been used in various targeted campaigns against both public and private subjects since late 2017. We observed multiple instances of attacks involving this RAT, and all of them happened in Central Asia. Among the targeted subjects were several important companies in the telecommunications and gas industries, and governmental entities.</p> <p>Moreover, we connect the dots between the latest campaign and three previously published reports: Kaspersky's Microcin against Russian military personnel, Palo Alto Networks' BYEBY against the Belarussian government and Checkpoint's Vicious Panda against the Mongolian public sector. Also, we discuss other malware that was typically a part of the attacker's toolset together with the RAT. We chose the name Mikrocean to cover all instances of the RAT, in acknowledgement of Kaspersky's initial report on the family. The misspelling is intentional, in order to avoid the established microbiological notion, but also to have at least phonemic agreement.</p>
Observed	Sectors: Defense, Government, Oil and gas and Telecommunications. Countries: Belarus, Mongolia, Russia and Central Asia.
Tools used	Gh0st RAT, logon.dll, logsupport.dll, Microcin, Mimikatz, pcaudit.bat and sqllauncher.dll
Information	< https://www.welivesecurity.com/2020/05/14/mikrocean-spying-backdoor-high-profile-networks-central-asia/ > < https://decoded.avast.io/luigicamastra/apt-group-planted-backdoors-targeting-high-profile-networks-in-central-asia/ > < https://securelist.com/microcin-is-here/97353/ >

Moafee

Names	Moafee (FireEye)
Country	China
Motivation	Information theft and espionage
First seen	2014
Description	<p>Moafee is a threat group that appears to operate from the Guangdong Province of China. Due to overlapping TTPs, including similar custom tools, Moafee is thought to have a direct or indirect relationship with the threat group DragonOK.</p> <p>(FireEye) The attack group “Moafee” (named after their command and control infrastructure) appears to operate out of the Guangdong province in China and is known to target the governments and military organizations of countries with national interests in the South China Sea. The seas in this region have multiple claims of sovereignty and hold high significance, as it is the second busiest sea-lane in the world and are known to be rich in resources such as rare earth metals, crude oil, and natural gas. We have also observed the Moafee group target organizations within the US defense industrial base.</p>
Observed	Sectors: Defense and Government. Countries: USA and “countries with national interests in the South China Sea.”
Tools used	Htran, Mongall, NewCT2, Nflog and Poison Ivy.
Information	< https://www.fireeye.com/content/dam/fireeye-www/global/en/current-threats/pdfs/wp-operation-quantum-entanglement.pdf >

Molerats, Extreme Jackal, Gaza Cybergang

Names	Molerats (<i>FireEye</i>) Extreme Jackal (<i>CrowdStrike</i>) Gaza Cybergang (<i>Kaspersky</i>) Gaza Hackers Team (<i>Kaspersky</i>) ATK 89 (<i>Thales</i>) TAG-CT5				
Country	[Gaza]				
Sponsor	Hamas				
Motivation	Information theft and espionage				
First seen	2012				
Description	<p>(<i>Kaspersky</i>) The Gaza cybergang is an Arabic-language, politically-motivated cybercriminal group, operating since 2012 and actively targeting the MENA (Middle East North Africa) region. The Gaza cybergang's attacks have never slowed down and its typical targets include government entities/embassies, oil and gas, media/press, activists, politicians, and diplomats.</p> <p>One of the interesting new facts, uncovered in mid-2017, is its discovery inside an oil and gas organization in the MENA region, infiltrating systems and pilfering data, apparently for more than a year.</p> <p>An overlap has been found between Molerats and Operation Parliament and these may also be an association with The Big Bang.</p>				
Observed	<p>Sectors: Aerospace, Defense, Embassies, Energy, Financial, Government, High-Tech, Media, Oil and gas, Retail, Telecommunications, journalists and software developers.</p> <p>Countries: Afghanistan, Algeria, Canada, China, Chile, Denmark, Egypt, Germany, India, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Latvia, Libya, Macedonia, Morocco, New Zealand, Oman, Palestine, Qatar, Russia, Saudi Arabia, Serbia, Slovenia, Somalia, South Korea, Syria, Turkey, UAE, UK, USA and Yemen, the BBC and the Office of the Quartet Representative.</p>				
Tools used	BadPatch, Downeks, DustySky, JhoneRAT, KasperAgent, Micropsia, Molerat Loader, njRAT, Pierogi, Poison Ivy, QuasarRAT, Scote, Spark and XtremeRAT.

Oct 2012	Operation "Molerats" In October 2012, malware attacks against Israeli government targets grabbed media attention as officials temporarily cut off Internet access for its entire police force and banned the use of USB memory sticks. Security researchers subsequently linked these attacks to a broader, yearlong campaign that targeted not just Israelis but Palestinians as well — and as discovered later, even the U.S. and UK governments. <https://www.fireeye.com/blog/threat-research/2013/08/operation-molerats-middle-east-cyber-attacks-using-poison-ivy.html>				

	Jun 2013	We observed several attacks in June and July 2013 against targets in the Middle East and the U.S. that dropped a PIVY payload that connected to command-and-control (CnC) infrastructure used by the Molerats attackers. <https://www.fireeye.com/blog/threat-research/2013/08/operation-molerats-middle-east-cyber-attacks-using-poison-ivy.html>
	Apr 2014	Between 29 April and 27 May, FireEye Labs identified several new Molerats attacks targeting at least one major U.S. financial institution and multiple, European government organizations. <https://www.fireeye.com/blog/threat-research/2014/06/molerats-here-for-spring.html>
	Summer 2014	Attacks against Israeli & Palestinian interests The decoy documents and filenames used in the attacks suggest the intended targets include organizations with political interests or influence in Israel and Palestine. <https://pwc.blogs.com/cyber_security_updates/2015/04/attacks-against-israeli-palestinian-interests.html>
	2014	Operation "Moonlight" Vectra Threat Labs researchers have uncovered the activities of a group of individuals currently engaged in targeted attacks against entities in the Middle East. We identified over 200 samples of malware generated by the group over the last two years. These attacks are themed around Middle Eastern political issues and the motivation appears to relate to espionage, as opposed to opportunistic or criminal intentions. <https://blog.vectra.ai/blog/moonlight-middle-east-targeted-attacks>
	May 2015	One interesting new fact about Gaza Cybergang activities is that they are actively sending malware files to IT (Information Technology) and IR (Incident Response) staff; this is also obvious from the file names they are sending to victims, which reflect the IT functions or IR tools used in cyberattack investigations. (<https://securelist.com/gaza-cybergang-wheres-your-ir-team/72283/>)
	Sep 2015	Operation "DustySky" These attacks are targeted, but not spear-phished. I.e., malicious email messages are sent to selected targets rather than random mass distribution, but are not tailored specifically to each and every target. Dozens of targets may receive the exact same message. The email message and the lure document are written in Hebrew, Arabic or English –depending on the target audience. Targeted sectors include governmental and diplomatic institutions, including embassies; companies from the aerospace and defense Industries; financial institutions; journalists; software developers. The attackers have been targeting software developers in general, using a fake website pretending to be a legitimate iOS management software, and linking to it in an online freelancing marketplace. <https://www.clearskysec.com/wp-content/uploads/2016/01/Operation%20DustySky_TLP_WHITE.pdf>
	Dec 2015	Palo Alto Networks Traps Advanced Endpoint Protection recently prevented recent attacks that we believe are part of a campaign linked to DustySky.

		< https://unit42.paloaltonetworks.com/unit42-downeks-and-quasar-rat-used-in-recent-targeted-attacks-against-governments/ >
	Apr 2016	<p>Operation “DustySky” Part 2</p> <p>Attacks against all targets in the Middle East stopped at once, after we published our first report. However, the attacks against targets in the Middle East (except Israel) were renewed in less than 20 days. In the beginning of April 2016, we found evidence that the attacks against Israel have been renewed as well. Based on the type of targets, on Gaza being the source of the attacks, and on the type of information the attackers are after –we estimate with medium-high certainty that the Hamas terrorist organization is behind these attacks.</p> <p><https://www.clearskysec.com/wp-content/uploads/2016/06/Operation-DustySky2_-6.2016_TLP_White.pdf></p> <p><https://kc.mcafee.com/resources/sites/MCAFEE/content/live/PRODUCT_DOCUMENTATION/26000/PD26760/en_US/McAfee_Labs_Threat_Advisory_GazaCybergang.pdf></p>
	Nov 2016	<p>PwC analysts have been tracking the same malware campaign, which has seen a noticeable spike since at least April 2016. The attackers have targeted Arabic news websites, political figures and other targets that possess influence in the Palestinian territories and other neighbouring Arab countries.</p> <p>Our investigation began by analyzing around 20 executable files associated with the attacks. Several of these files opened decoy documents and audio files, which were exclusively in Arabic-language.</p> <p><https://pwc.blogs.com/cyber_security_updates/2016/11/molerats-theres-more-to-the-naked-eye.html></p>
	Mid-2017	<p>New targets, use of MS Access Macros and CVE 2017-0199, and possible mobile espionage</p> <p>One of the interesting new facts, uncovered in mid-2017, is its discovery inside an oil and gas organization in the MENA region, infiltrating systems and pilfering data, apparently for more than a year. Another interesting finding is the use of the recently discovered CVE 2017-0199 vulnerability, and Microsoft Access files into which the download scripts were embedded to reduce the likelihood of their detection. Traces of mobile malware that started to appear from late April 2017, are also being investigated.</p> <p><https://securelist.com/gaza-cybergang-updated-2017-activity/82765/></p>
	Sep 2017	<p>Operation “TopHat”</p> <p>In recent months, Palo Alto Networks Unit 42 observed a wave of attacks leveraging popular third-party services Google+, Pastebin, and bit.ly.</p> <p>The attacks we found within the TopHat campaign began in early September 2017. In a few instances, original filenames of the identified samples were written in Arabic.</p> <p><https://unit42.paloaltonetworks.com/unit42-the-tophat-campaign-attacks-within-the-middle-east-region-using-popular-third-party-services/></p>
	Jan 2019	<p>“Spark” Campaign</p> <p>This campaign uses social engineering to infect victims, mainly from the Palestinian territories, with the Spark backdoor. This backdoor first</p>

		<p>emerged in January 2019 and has been continuously active since then. The campaign's lure content revolves around recent geopolitical events, specifically the Israeli-Palestinian conflict, the assassination of Qasem Soleimani, and the ongoing conflict between Hamas and Fatah Palestinian movements.</p> <p><https://www.cybereason.com/blog/new-cyber-espionage-campaigns-targeting-palestinians-part-one></p>
	Feb 2019	<p>New Attack in the Middle East</p> <p>Recently, 360 Threat Intelligence Center captured a bait document designed specifically for Arabic users. It is an Office Word document with malicious macros embedded to drop and execute a backdoor packed by Enigma Virtual Box. The backdoor program has a built-in keyword list containing names of people or opera movies to communicate with C2, distributes control commands to further control the victim's computer device. After investigation, we suspect this attack is carried out by Molerats.</p> <p><https://ti.360.net/blog/articles/suspected-molerats-new-attack-in-the-middle-east-en/></p>
	Apr 2019	<p>Operation "SneakyPastes"</p> <p>The campaign is multistage. It begins with phishing, using letters from one-time addresses and one-time domains. Sometimes the letters contain links to malware or infected attachments. If the victim executes the attached file (or follows the link), their device receives Stage One malware programmed to activate the infection chain.</p> <p><https://www.kaspersky.com/blog/gaza-cybergang/26363/></p>
	Oct 2019	<p>Between October 2019 through the beginning of December 2019, Unit 42 observed multiple instances of phishing attacks likely related to a threat group known as Molerats (AKA Gaza Hackers Team and Gaza Cybergang) targeting eight organizations in six different countries in the government, telecommunications, insurance and retail industries, of which the latter two were quite peculiar.</p> <p><https://unit42.paloaltonetworks.com/molerats-delivers-spark-backdoor/></p>
	Dec 2019	<p>"Pierogi" Campaign</p> <p>This campaign uses social engineering attacks to infect victims with a new, undocumented backdoor dubbed Pierogi. This backdoor first emerged in December 2019, and was discovered by Cybereason. In this campaign, the attackers use different TTPs and decoy documents reminiscent of previous campaigns by MoleRATs involving the Micropsia and Kaperagent malware.</p> <p><https://www.cybereason.com/blog/new-cyber-espionage-campaigns-targeting-palestinians-part-one></p>
	Mar 2020	<p>Molerats Delivers Spark Backdoor to Government and Telecommunications Organizations</p> <p><https://unit42.paloaltonetworks.com/molerats-delivers-spark-backdoor/></p> <p><https://www.bleepingcomputer.com/news/security/hackers-hide-malware-c2-communication-by-faking-news-site-traffic/></p>
MITRE ATT&CK	< https://attack.mitre.org/groups/G0021/ >	

MoneyTaker

Names	MoneyTaker (<i>Group-IB</i>)
Country	Russia
Motivation	Financial crime
First seen	2016
Description	<p>(Group-IB) In less than two years, this group has conducted over 20 successful attacks on financial institutions and legal firms in the USA, UK and Russia. The group has primarily been targeting card processing systems, including the AWS CBR (Russian Interbank System) and purportedly SWIFT (US). Given the wide usage of STAR in LATAM, financial institutions in LATAM could have particular exposure to a potential interest from the MoneyTaker group.</p> <p>Although the group has been successful at targeting a number of banks in different countries, to date, they have gone unreported. In addition to banks, the MoneyTaker group has attacked law firms and also financial software vendors. In total, Group-IB has confirmed 20 companies as MoneyTaker victims, with 16 attacks on US organizations, 3 attacks on Russian banks and 1 in the UK.</p>
Observed	Sectors: Financial. Countries: Russia, UK and USA.
Tools used	Citadel, Kronos, Metasploit, MoneyTaker and Screenshotter.

MuddyWater, Seedworm, TEMP.Zagros, Static Kitten

Names	MuddyWater (<i>Palo Alto</i>) Seedworm (<i>Symantec</i>) TEMP.Zagros (<i>FireEye</i>) Static Kitten (<i>CrowdStrike</i>) TA450 (<i>Proofpoint</i>) ATK 51 (<i>Thales</i>) T-APT-14 (<i>Tencent</i>)	
Country	Iran	
Motivation	Information theft and espionage	
First seen	2017	
Description	<p>(Reaqta) MuddyWater is an APT group that has been active throughout 2017, targeting victims in Middle East with in-memory vectors leveraging on Powershell, in a family of attacks now identified as “Living off the land”, as they don’t require the creation of new binaries on the victim’s machine, thus maintaining a low detection profile and a low forensic footprint.</p> <p>The operators behind MuddyWater are likely espionage motivated, we derive this information from the analysis of data and backdoors behaviors. We also find that despite the strong preponderance of victims from Pakistan, the most active targets appear to be in: Saudi Arabia, UAE and Iraq. Amongst the victims we identify a variety of entities with a stronger focus at Governments, Telcos and Oil companies.</p> <p>By tracking the operations we finally figure out that the originating country is likely to be Iran, while it remains harder to ascertain whether MuddyWater is state sponsored or a criminal organization incline to espionage.</p>	
Observed	<p>Sectors: Defense, Education, Energy, Financial, Food and Agriculture, Gaming, Government, Healthcare, High-Tech, IT, Media, NGOs, Oil and gas, Telecommunications and Transportation.</p> <p>Countries: Afghanistan, Armenia, Austria, Azerbaijan, Bahrain, Belarus, Egypt, Georgia, India, Iran, Iraq, Israel, Jordan, Lebanon, Mali, Netherlands, Oman, Pakistan, Russia, Saudi Arabia, Tajikistan, Tunisia, Turkey, UAE, Ukraine and USA.</p>	
Tools used	ChromeCookiesView, chrome-passwords, CLOUDSTATS, CrackMapExec, DELPHSTATS, EmpireProject, FruityC2, Koadic, LaZagne, Meterpreter, Mimikatz, Mudwater, MZCookiesView, Powermud, PowerSploit, POWERSTATS, PRB-Backdoor, QUADAGENT, SHARPSTATS, Shootback, Smbmap and Living off the Land.	
Operations performed	Feb 2017	The MuddyWater attacks are primarily against Middle Eastern nations. However, we have also observed attacks against surrounding nations and beyond, including targets in India and the USA. https://unit42.paloaltonetworks.com/unit42-muddying-the-water-targeted-attacks-in-the-middle-east/
	Jan 2018	Updated Tactics, Techniques and Procedures in Spear Phishing Campaign We attribute this activity to TEMP.Zagros (reported by Palo Alto Networks and Trend Micro as MuddyWater), an Iran-nexus actor that has been active since at least May 2017. This actor has engaged in prolific spear phishing of government and defense entities in Central and Southwest Asia.

		< https://www.fireeye.com/blog/threat-research/2018/03/iranian-threat-group-updates-ttps-in-spear-phishing-campaign.html >
Mar 2018	Campaign Possibly Connected to “MuddyWater” Surfaces in the Middle East and Central Asia We discovered a new campaign targeting organizations in Turkey, Pakistan and Tajikistan that has some similarities with an earlier campaign named MuddyWater, which hit various industries in several countries, primarily in the Middle East and Central Asia. < https://blog.trendmicro.com/trendlabs-security-intelligence/campaign-possibly-connected-muddywater-surfaces-middle-east-central-asia/ >	
May 2018	Another Potential MuddyWater Campaign uses Powershell-based PRB-Backdoor In May 2018, we found a new sample (Detected as W2KM_DLOADDR.UHAOEEN) that may be related to this campaign. Like the previous campaigns, these samples again involve a Microsoft Word document embedded with a malicious macro that is capable of executing PowerShell (PS) scripts leading to a backdoor payload. One notable difference in the analyzed samples is that they do not directly download the Visual Basic Script(VBS) and PowerShell component files, and instead encode all the scripts on the document itself. The scripts will then be decoded and dropped to execute the payload without needing to download the component files. < https://blog.trendmicro.com/trendlabs-security-intelligence/another-potential-muddywater-campaign-uses-powershell-based-prb-backdoor/ >	
May 2018	We recently noticed a large amount of spear phishing documents that appear to be targeting government bodies, military entities, telcos and educational institutions in Jordan, Turkey, Azerbaijan and Pakistan, in addition to the continuous targeting of Iraq and Saudi Arabia, other victims were also detected in Mali, Austria, Russia, Iran and Bahrain.. These new documents have appeared throughout 2018 and escalated from May onwards. The attacks are still ongoing. < https://securelist.com/muddywater/88059/ >	
Sep 2018	Group remains highly active with more than 130 victims in 30 organizations hit since September 2018. Seedworm’s motivations are much like many cyber espionage groups that we observe—they seek to acquire actionable information about the targeted organizations and individuals. They accomplish this with a preference for speed and agility over operational security, which ultimately led to our identification of their key operational infrastructure. < https://www.symantec.com/blogs/threat-intelligence/seedworm-espionage-group >	
Nov 2018	Operations in Lebanon and Oman MuddyWater has recently been targeting victims likely from Lebanon and Oman, while leveraging compromised domains, one of which is owned by an Israeli web developer. The investigation aimed to uncover additional details regarding the compromise vector. Further, we wished to determine the infection vector, which is currently unknown. With that in mind, past experience implies that this might be a two-stage spear-phishing campaign.	

		< https://www.clearskysec.com/wp-content/uploads/2018/11/MuddyWater-Operations-in-Lebanon-and-Oman.pdf >
	Apr 2019	<p>Targeting Kurdish Political Groups and Organizations in Turkey</p> <p>However, unlike the previous vector, we did not identify this time any compromised servers used to host the malware's code. Instead, the lure document already contains the malicious code. We also detected five additional files that operate in a similar file to the aforementioned document; but unlike that file, these do not have any content.</p> <p><https://www.clearskysec.com/muddywater-targets-kurdish-groups-turkish-orgs/></p>
	Apr 2019	<p>The Iranian APT, MuddyWater, has been active since at least 2017.</p> <p>Most recently though, a new campaign, targeting Belarus, Turkey and Ukraine, has emerged that caught the attention of Check Point researchers.</p> <p><https://research.checkpoint.com/the-muddy-waters-of-apt-attacks/></p>
	Apr 2019	<p>Operation "BlackWater"</p> <p>Newly associated samples from April 2019 indicate attackers have added three distinct steps to their operations, allowing them to bypass certain security controls and suggesting that MuddyWater's tactics, techniques and procedures (TTPs) have evolved to evade detection.</p> <p><https://blog.talosintelligence.com/2019/05/recent-muddywater-associated-blackwater.html></p>
	Jun 2019	<p>Clearsky has detected new and advanced attack vector used by MuddyWater to target governmental entities and the telecommunication sector. Notably, the TTP includes decoy documents exploiting CVE-2017-0199 as the first stage of the attack.</p> <p>This is followed by the second stage of the attack – communication with the hacked C2 servers and downloading a file infected with the macros.</p> <p><https://www.clearskysec.com/muddywater2/></p>
	Jun 2019	<p>We came across new campaigns that seem to bear the markings of MuddyWater – a threat actor group with a history of targeting organizations in Middle Eastern and Asian countries. The group used new tools and payloads in campaigns over the first half of 2019, pointing to the continued work the group has put in since our last report on MuddyWater in November 2018.</p> <p><https://documents.trendmicro.com/assets/white_papers/wp_new_muddywater_findings_uncovered.pdf></p>
Counter operations	May 2019	<p>New leaks of Iranian cyber-espionage operations hit Telegram and the Dark Web</p> <p><https://www.zdnet.com/article/new-leaks-of-iranian-cyber-espionage-operations-hit-telegram-and-the-dark-web/></p>

Mustang Panda, Bronze President

Names	Mustang Panda (<i>CrowdStrike</i>) Bronze President (<i>SecureWorks</i>) TEMP.Hex (<i>FireEye</i>) HoneyMyte (<i>Kaspersky</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2014	
Description	<p>(CrowdStrike) In April 2017, CrowdStrike Falcon Intelligence observed a previously unattributed actor group with a Chinese nexus targeting a U.S.-based think tank. Further analysis revealed a wider campaign with unique tactics, techniques, and procedures (TTPs). This adversary targets non-governmental organizations (NGOs) in general, but uses Mongolian language decoys and themes, suggesting this actor has a specific focus on gathering intelligence on Mongolia. These campaigns involve the use of shared malware like Poison Ivy or PlugX.</p> <p>Recently, Falcon Intelligence observed new activity from Mustang Panda, using a unique infection chain to target likely Mongolia-based victims. This newly observed activity uses a series of redirections and fileless, malicious implementations of legitimate tools to gain access to the targeted systems. Additionally, Mustang Panda actors reused previously-observed legitimate domains to host files.</p>	
Observed	<p>Sectors: Aviation, Government, NGOs and Think Tanks. Countries: Australia, Bangladesh, Belgium, China, Ethiopia, Germany, Hong Kong, India, Mongolia, Myanmar, Nepal, Pakistan, Singapore, South Korea, Taiwan, UK, UN, USA and Vietnam.</p>	
Tools used	AdFind, China Chopper, Cobalt Strike, nbtscan, NetSess, Netview, nmap, Orat, Poison Ivy, PlugX, Powerview.ps1, PVE Find AD User, RCSession, TeamViewer and WmiExec.	
Operations performed	2014	Secureworks Counter Threat Unit (CTU) researchers have observed BRONZE PRESIDENT activity since mid-2018 but identified artifacts suggesting that the threat actors may have been conducting network intrusions as far back as 2014. <https://www.secureworks.com/research/bronze-president-targets-ngos>
	Aug 2019	In mid-August 2019, the Anomali Threat Research Team discovered suspicious ".Ink" files during routine intelligence collection. While the distribution method of these documents cannot be confirmed at this time, it is likely that spearphishing is being utilized because it aligns with Mustang Panda's TTPs, and it is a common tactic used amongst APT actors. <https://www.anomali.com/blog/china-based-apt-mustang-panda-targets-minority-groups-public-and-private-sector-organizations#When:17:14:00Z>
	Jan 2020	Avira's Advanced Threat Research team discovered a new version of PlugX from the Mustang Panda APT that is used to spy on some targets in Hong Kong and Vietnam. The way that the APT actor infects the target, and launches the malicious payload is similar to previous versions—but with some differences.

		< https://insights.oem.avira.com/new-wave-of-plugx-targets-hong-kong/ >
	Mar 2020	Vietnamese cyber-security firm VinCSS detected a Chinese state-sponsored hacking group (codenamed Mustang Panda) spreading emails with a RAR file attachment purporting to carry a message about the coronavirus outbreak from the Vietnamese Prime Minister. < https://blog.vincss.net/2020/03/re012-phan-tich-ma-doc-loi-dung-dich-COVID-19-de-phat-tan-gia-mao-chi-thi-cua-thu-tuong-Nguyen-Xuan-Phuc.html >
	Mar 2020	ATR identified that the Higaisa and Mustang Panda Advanced Persistent Threat (APT) groups have been utilizing Coronavirus-themed lures in their campaigns. < https://www.anomali.com/blog/covid-19-themes-are-being-utilized-by-threat-actors-of-varying-sophistication#When:14:00:00Z >

Naikon, Lotus Panda

Names	Naikon (<i>Kaspersky</i>) Hellsing (<i>Kaspersky</i>) Lotus Panda (<i>CrowdStrike</i>)
Country	China
Sponsor	State-sponsored, PLA Unit 78020
Motivation	Information theft and espionage
First seen	2012
Description	Naikon is a threat group that has focused on targets around the South China Sea. The group has been attributed to the Chinese People's Liberation Army's (PLA) Chengdu Military Region Second Technical Reconnaissance Bureau (Military Unit Cover Designator 78020). While Naikon shares some characteristics with APT 30 , the two groups do not appear to be exact matches.
Observed	Sectors: Defense, Energy, Government, Law enforcement and Media. Countries: Australia, Brunei, Cambodia, China, India, Indonesia, Laos, Malaysia, Myanmar, Nepal, Philippines, Saudi Arabia, Singapore, South Korea, Thailand, USA and Vietnam.
Tools used	8.t Dropper, Aria-body, Aria-body loader, BackBend, Backspace, Creamsicle, Flashflood, Gemcutter, HDoor, JadeRAT, Milkmaid, Naikon, NetEagle, NewCore RAT, Orangeade, PlugX, RARSTONE, Shipshape, Sisfader, Spaceship, SsIMM, Sys10, TeamViewer, WinMM, xsPlus and Living off the Land.
Operations performed	2012 Naikon downloader/backdoor
	2013 “MsnMM” Campaigns <https://media.kasperskycontenthub.com/wp-content/uploads/sites/43/2018/03/07205555/TheNaikonAPT-MsnMM1.pdf>
	Feb 2013 BKDR_RARSTONE RAT Last year, we reported about PlugX a breed of Remote Access Trojan (RAT) used in certain high-profile APT campaigns. We also noted some of its noteworthy techniques, which include its capability to hide its malicious codes by decrypting and loading a backdoor “executable file” directly into memory, without the need to drop the actual “executable file”. Recently, we uncovered a RAT using the same technique. The new sample detected by Trend Micro as BKDR_RARSTONE.A is similar (but not) PlugX, as it directly loads a backdoor “file” in memory without dropping any “file”. However, as we proceeded with our analysis, we found that BKDR_RARSTONE has some tricks of its own. <https://blog.trendmicro.com/trendlabs-security-intelligence/bkdr_rarstone-new-rat-to-watch-out-for/>
	Mar 2014 Campaign in the wake of the MH370 tragedy By March 11 th , the Naikon group was actively hitting most of the nations involved in the search for MH370. The targets were extremely wide-ranging but included institutions with access to information related to the disappearance of MH370. <https://securelist.com/the-chronicles-of-the-hellsing-apt-the-empire-strikes-back/69567/>

	Sep 2015	Operation “CameraShy” < https://threatconnect.com/blog/camerashy-intro/ >
	2017	Recently Check Point Research discovered new evidence of an ongoing cyber espionage operation against several national government entities in the Asia Pacific (APAC) region. This operation, which we were able to attribute to the Naikon APT group, used a new backdoor named Aria-body, in order to take control of the victims’ networks. < https://research.checkpoint.com/2020/naikon-apt-cyber-espionage-reloaded/ >

Nazar

Names	Nazar (<i>Epic Turla</i>) SIG37 (NSA) Iron Tiger (CrySys)
Country	Iran
Motivation	Information theft and espionage
First seen	2008
Description	<p>(Epic Turla) It's hard to understand the scope of this operation without access to victimology (e.g.: endpoint visibility or command-and-control sinkholing). Additionally, some possible timestamping muddies the water between this operation possibly originating in 2008-2009 or actually coming into full force in 2010-2013 (the latter dates being corroborated by VT firstseen submission times and second-stage drop timestamps). There's a level of variable developmental capability visible throughout the stages. Multiple components are abused commonly-available resources, while the orchestrator and two of the DLL drops actually display some developmental ingenuity (in the form of seemingly novel COM techniques). Far from the most advanced coding practices but definitely better than the sort of .NET garbage other 'Farsi-speaking' APTs have gotten away with in the past.</p> <p>Somehow, this operation found its way onto the NSA's radar pre-2013. As far as I can tell, it's eluded specific coverage from the security industry. A possible scenario to account for the disparate visibility between the NSA and Western researchers when it comes to this cluster of activity is that these samples were exclusively encountered on Iranian boxes overlapping with EQGRP implants. Submissions of Nazar subcomponents from Iran (as well as privately shared visibility into historical and ongoing victimology clustered entirely on Iranian machines) could support that theory. Perhaps this is an internal monitoring framework (a la Attor) but given the sparse availability of historical data, I wouldn't push that beyond a low-confidence assessment, at this time.</p>
Observed	
Tools used	Distribute.exe, EYService, GpUpdates.exe and Microolap Packet Sniffer.

Neodymium

Names	Neodymium (<i>Microsoft</i>)
Country	Turkey
Motivation	Information theft and espionage
First seen	2016
Description	<p>Neodymium is an activity group that conducted a campaign in May 2016 and has heavily targeted Turkish victims. The group has demonstrated similarity to another activity group called Promethium, StrongPity due to overlapping victim and campaign characteristics. Neodymium is reportedly associated closely with BlackOasis operations, but evidence that the group names are aliases has not been identified.</p> <p>(Microsoft) Neodymium is an activity group that is known to use a backdoor malware detected by Microsoft as Wingbird. This backdoor's characteristics closely match FinFisher, a government-grade commercial surveillance package. Data about Wingbird activity indicate that it is typically used to attack individual computers instead of networks.</p>
Observed	Countries: Europe.
Tools used	Wingbird.

NetTraveler, APT 21, Hammer Panda

Names	NetTraveler (<i>Kaspersky</i>) APT 21 (<i>Mandiant</i>) Hammer Panda (<i>CrowdStrike</i>) TEMP.Zhenbao (<i>FireEye</i>)				
Country	China				
Motivation	Information theft and espionage				
First seen	2004				
Description	<p>(<i>Kaspersky</i>) Over the last few years, we have been monitoring a cyber-espionage campaign that has successfully compromised more than 350 high profile victims in 40 countries. The main tool used by the threat actors during these attacks is NetTraveler, a malicious program used for covert computer surveillance.</p> <p>The name NetTraveler comes from an internal string which is present in early versions of the malware: NetTraveler Is Running! This malware is used by APT actors for basic surveillance of their victims. Earliest known samples have a timestamp of 2005, although references exist indicating activity as early as 2004. The largest number of samples we observed were created between 2010 and 2013.</p> <p>The later group RedAlpha has infrastructure overlap with NetTraveler.</p>				
Observed	Sectors: Defense, Embassies, Government, Oil and gas, Scientific research centers and institutes and Tibetan/Uyghur activists. Countries: Afghanistan, Australia, Austria, Bangladesh, Belarus, Belgium, Cambodia, Canada, Chile, China, Germany, Greece, Hong Kong, India, Indonesia, Iran, Japan, Jordan, Kazakhstan, Kyrgyzstan, Lithuania, Malaysia, Mongolia, Morocco, Nepal, Pakistan, Qatar, Russia, Slovenia, South Korea, Spain, Suriname, Syria, Tajikistan, Thailand, Turkey, Turkmenistan, UK, Ukraine, USA and Uzbekistan.

Night Dragon

Names	Night Dragon (McAfee)
Country	China
Motivation	Information theft and espionage
First seen	2009
Description	<p>(McAfee) Starting in November 2009, coordinated covert and targeted cyberattacks have been conducted against global oil, energy, and petrochemical companies. These attacks have involved social engineering, spear-phishing attacks, exploitation of Microsoft Windows operating systems vulnerabilities, Microsoft Active Directory compromises, and the use of remote administration tools (RATs) in targeting and harvesting sensitive competitive proprietary operations and project-financing information with regard to oil and gas field bids and operations.</p> <p>Attackers using several locations in China have leveraged C&C servers on purchased hosted services in the United States and compromised servers in the Netherlands to wage attacks against global oil, gas, and petrochemical companies, as well as individuals and executives in Kazakhstan, Taiwan, Greece, and the United States to acquire proprietary and highly confidential information. The primary operational technique used by the attackers comprised a variety of hacker tools, including privately developed and customized RAT tools that provided complete remote administration capabilities to the attacker. RATs provide functions similar to Citrix or Microsoft Windows Terminal Services, allowing a remote individual to completely control the affected system. To deploy these tools, attackers first compromised perimeter security controls, through SQL-injection exploits of extranet web servers, as well as targeted spear-phishing attacks of mobile worker laptops, and compromising corporate VPN accounts to penetrate the targeted company's defensive architectures (DMZs and firewalls) and conduct reconnaissance of targeted companies' networked computers.</p> <p>Night Dragon may be related to APT 18, Dynamite Panda, Wekby.</p>
Observed	Sectors: Energy, Oil and gas and Petrochemical. Countries: Greece, Kazakhstan, Netherlands, Taiwan and USA.
Tools used	ASPXSpy, Cain & Abel, gsecdump and zwShell.
Information	< https://securingtomorrow.mcafee.com/wp-content/uploads/2011/02/McAfee_NightDragon_wp_draft_to_customersv1-1.pdf >

Nightshade Panda, APT 9, Group 27

Names	Nightshade Panda (<i>CrowdStrike</i>) APT 9 (<i>Mandiant</i>) Group 27 (<i>ASERT</i>) FlowerLady (<i>Context</i>) FlowerShow (<i>Context</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(Softpedia) Arbor's ASERT team is now reporting that, after looking deeper at that particular campaign, and by exposing a new trail in the group's activities, they managed to identify a new RAT that was undetectable at that time by most antivirus vendors.</p> <p>Named Trochilus, this new RAT was part of Group 27's malware portfolio that included six other malware strains, all served together or in different combinations, based on the data that needed to be stolen from each victim.</p> <p>This collection of malware, dubbed the Seven Pointed Dagger by ASERT experts, included two different PlugX versions, two different Trochilus RAT versions, one version of the 3012 variant of the 9002 RAT, one EvilGrab RAT version, and one unknown piece of malware, which the team has not entirely decloaked just yet.</p>	
Observed	Sectors: Energy, Government, Media and Utilities. Countries: Myanmar, Thailand, USA and Europe.	
Tools used	3102 RAT, 9002 RAT, EvilGrab RAT, MoonWind RAT, PlugX, Poison Ivy and Trochilus RAT.	
Operations performed	May 2015	Operation "Seven Pointed Dagger" During that campaign, the threat actor identified as Group 27 used watering hole attacks on official Myanmar government websites to infect unsuspecting users with the PlugX malware (an RAT) when accessing information on the upcoming Myanmar elections. <https://news.softpedia.com/news/trochilus-rat-evades-antivirus-detection-used-for-cyber-espionage-in-south-east-asia-498776.shtml> <https://unit42.paloaltonetworks.com/evilgrab-delivered-by-watering-hole-attack-on-president-of-myanmars-website/> <http://pages.arbornetworks.com/rs/082-KNA-087/images/ASERT%20Threat%20Intelligence%20Brief%202015-05%20PlugX%20Threat%20Activity%20in%20Myanmar.pdf>
	May 2015	Chinese Actors Use '3102' Malware in Attacks on US Government and EU Media <https://unit42.paloaltonetworks.com/chinese-actors-use-3102-malware-in-attacks-on-us-government-and-eu-media/>
	Sep 2016	From September 2016 through late November 2016, a threat actor group used both the Trochilus RAT and a newly identified RAT we've named MoonWind to target organizations in Thailand, including a utility organization. We chose the name 'MoonWind' based on debugging strings we saw within the samples, as well as the compiler used to generate the samples. The attackers compromised two

		legitimate Thai websites to host the malware, which is a tactic this group has used in the past. < https://unit42.paloaltonetworks.com/unit42-trochilus-rat-new-moonwind-rat-used-attack-thai-utility-organizations/ >
--	--	---

NineBlog

Names	NineBlog (<i>FireEye</i>)
Country	China
Motivation	Information theft and espionage
First seen	2013
Description	<p>(<i>FireEye</i>) FireEye has been tracking ongoing activity associated with a unique and relatively stealthy group we first identified in 2013 using the name “APT.NineBlog.” The name NINEBLOG refers to a specific backdoor used by the threat group; some versions of the backdoor use the string ‘nineblog’ in their command and control (CnC) URI path.</p> <p>We have observed this group targeting organizations primarily in South Asia and the Middle East. The threat group is notable because it employs Visual Basic Scripts (VBScripts) as a backdoor, a tactic we do not often observe. The group can maintain a low profile probably because the VBScripts are small and stealthy in their execution. The NINEBLOG malware is difficult to detect because the VBScripts are encoded and the actors employ SSL network communications. We have observed intermittent activity from this group since we first identified it in 2013, and we saw a spike in activity during mid-2015.</p> <p>We assess that one of the probable targets of the group’s 2015 campaign is a Southeast Asian government, based on the specificity of some of the decoy documents.</p> <p>In addition to the anti-analysis techniques, the group has used SSL communications since we first identified this activity in 2013. The use of encrypted SSL traffic makes it extremely difficult to develop network-based signatures to detect the malware’s communications.</p>
Observed	Sectors: Government. Countries: South Asia, Southeast Asia and Middle East.
Tools used	NineBlog.
Information	< https://www.fireeye.com/blog/threat-research/2013/08/the-curious-case-of-encoded-vb-scripts-apt-nineblog.html > < https://www2.fireeye.com/rs/848-DID-242/images/rpt-southeast-asia-fall-2015.pdf >

Nitro, Covert Grove

Names	Nitro (Symantec) Covert Grove (Symantec)	
Country	China	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(Symantec) The Nitro Attacks: Stealing Secrets from the Chemical Industry The attackers have changed their targets over time. From late April to early May, the attackers focused on human rights related NGOs. They then moved on to the motor industry in late May. From June until mid-July no activity was detected. At this point, the current attack campaign against the chemical industry began. This particular attack has lasted much longer than previous attacks, spanning two and a half months.</p> <p>A total of 29 companies in the chemical sector were confirmed to be targeted in this attack wave and another 19 in various other sectors, primarily the defense sector, were seen to be affected as well. These 48 companies are the minimum number of companies targeted and likely other companies were also targeted. In a recent two week period, 101 unique IP addresses contacted a command and control server with traffic consistent with an infected machine. These IPs represented 52 different unique Internet Service Providers or organizations in 20 countries.</p> <p>Nitro may be related to APT 18, Dynamite Panda, Wekby.</p>	
Observed	<p>Sectors: Automotive, Chemical, NGOs and Technology. Countries: Argentina, Bangladesh, Canada, China, Czech, Finland, France, Germany, Hong Kong, India, Japan, Netherlands, Norway, Russia, Singapore, South Korea, Sweden, Taiwan, UK and USA.</p>	
Tools used	Gh0st RAT, PCClient, Poison Ivy and Spindest.	
Operations performed	Jul 2014	New Indicators of Compromise found Historically, Nitro is known for targeted spear phishing campaigns and using Poison Ivy malware, which was not seen in these attacks. Since at least 2013, Nitro appears to have somewhat modified their malware and delivery methods to include Spindest and legitimate compromised websites, as reported by Cyber Squared's TCIRT. https://unit42.paloaltonetworks.com/new-indicators-compromise-apt-group-nitro-uncovered/
Information	https://www.symantec.com/content/en/us/enterprise/media/security_response/whitepapers/the_nitro_attacks.pdf https://blog.trendmicro.com/trendlabs-security-intelligence/the-significance-of-the-nitro-attacks/	

OilRig, APT 34, Helix Kitten, Chrysene

Names	OilRig (<i>Palo Alto</i>) APT 34 (<i>FireEye</i>) Helix Kitten (<i>CrowdStrike</i>) Twisted Kitten (<i>CrowdStrike</i>) Crambus (<i>Symantec</i>) Chrysene (<i>Dragos</i>) TA452 (<i>Proofpoint</i>) IRN2 (<i>Area 1</i>) ATK 40 (<i>Thales</i>) ITG13 (<i>IBM</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2014	
Description	<p>OilRig is a threat group with suspected Iranian origins that has targeted Middle Eastern and international victims since at least 2014. The group has targeted a variety of industries, including financial, government, energy, chemical, and telecommunications, and has largely focused its operations within the Middle East. It appears the group carries out supply chain attacks, leveraging the trust relationship between organizations to attack their primary targets. FireEye assesses that the group works on behalf of the Iranian government based on infrastructure details that contain references to Iran, use of Iranian infrastructure, and targeting that aligns with nation-state interests. This group was previously tracked under two distinct groups, APT 34 and OilRig, but was combined due to additional reporting giving higher confidence about the overlap of the activity.</p> <p>OilRig has 1 subgroup:</p> <ol style="list-style-type: none">1. Subgroup: Greenbug, Volatile Kitten <p>OilRig seems to be closely related to APT 33, Elfin, Magnallium since at least 2017 and perhaps DNSpionage.</p>	
Observed	<p>Sectors: Aviation, Chemical, Education, Energy, Financial, Government, High-Tech, Hospitality, Oil and gas, and Telecommunications.</p> <p>Countries: Azerbaijan, Iraq, Israel, Kuwait, Lebanon, Mauritius, Pakistan, Qatar, Saudi Arabia, Turkey, UAE, UK and USA.</p>	
Tools used	Alma Communicator, BONDUPDATER, certutil, Clayslide, DistTrack, DNSpionage, Dustman, Fox Panel, GoogleDrive RAT, Helminth, ISMAgent, ISMDoor, ISMInjector, Jason, Karkoff, LaZagne, LONGWATCH, Mimikatz, Nautilus, Neuron, OilRig, OopsIE, PICKPOCKET, POWBAT, POWRUNER, PsList, QUADAGENT, RGDoor, SpyNote RAT, StoneDrill, ThreeDollars, TONEDEAF, TONEDEAF 2.0, TwoFace, VALUEVAULT, Webmask, ZeroCleare and Living off the Land.	
Operations performed	Aug 2012	Shamoon Attacks W32.Distrack is a new threat that is being used in specific targeted attacks against at least one organization in the energy sector. It is a destructive malware that corrupts files on a compromised computer and overwrites the MBR (Master Boot Record) in an effort to render a computer unusable. Target: Saudi Aramco and Rasgas.

		< https://www.symantec.com/connect/blogs/shamoon-attacks >
May 2016	Targeted Attacks against Banks in the Middle East In the first week of May 2016, FireEye's DTI identified a wave of emails containing malicious attachments being sent to multiple banks in the Middle East region. The threat actors appear to be performing initial reconnaissance against would-be targets, and the attacks caught our attention since they were using unique scripts not commonly seen in crimeware campaigns. < https://www.fireeye.com/blog/threat-research/2016/05/targeted_attacksaga.html > < https://unit42.paloaltonetworks.com/the-oilrig-campaign-attacks-on-saudi-arabian-organizations-deliver-helminth-backdoor/ >	
Jun 2016	We have identified two separate testing efforts carried out by the OilRig actors, one occurring in June and one in November of 2016. The sample set associated with each of these testing activities is rather small, but the changes made to each of the files give us a chance to understand what modifications the actor performs in an attempt to evade detection. This testing activity also suggests that the threat group responsible for the OilRig attack campaign have an organized, professional operations model that includes a testing component to the development of their tools. < https://unit42.paloaltonetworks.com/unit42-oilrig-actors-provide-glimpse-development-testing-efforts/ >	
Oct 2016	In recent weeks we've discovered that the group have been actively updating their Clayslide delivery documents, as well as the Helminth backdoor used against victims. Additionally, the scope of organizations targeted by this group has expanded to not only include organizations within Saudi Arabia, but also a company in Qatar and government organizations in Turkey, Israel and the United States. < https://unit42.paloaltonetworks.com/unit42-oilrig-malware-campaign-updates-toolset-and-expands-targets/ >	
Nov 2016	Shamoon v2 The malware used in the recent attacks (W32.Distrack.B) is largely unchanged from the variant used four years ago. In the 2012 attacks, infected computers had their master boot records wiped and replaced with an image of a burning US flag. The latest attacks instead used a photo of the body of Alan Kurdi, the three year-old Syrian refugee who drowned in the Mediterranean last year. < https://www.symantec.com/connect/blogs/shamoon-back-dead-and-destructive-ever > < https://unit42.paloaltonetworks.com/unit42-shamoon-2-return-distrack-wiper/ > < https://unit42.paloaltonetworks.com/unit42-second-wave-shamoon-2-attacks-identified/ >	
Jan 2017	Delivers Digitally Signed Malware, Impersonates University of Oxford In recent attacks they set up a fake VPN Web Portal and targeted at least five Israeli IT vendors, several financial institutes, and the Israeli Post Office. Later, the attackers set up two fake websites pretending to be a University of Oxford conference sign-up page and a job application website. In these websites they hosted malware that was digitally signed with a valid, likely stolen code signing certificate.	

		< https://www.clearskysec.com/oilrig/ >
	Jun 2017	In July 2017, we observed the OilRig group using a tool they developed called ISMAgent in a new set of targeted attacks. The OilRig group developed ISMAgent as a variant of the ISMDoor Trojan. In August 2017, we found this threat group has developed yet another Trojan that they call 'Agent Injector' with the specific purpose of installing the ISMAgent backdoor. We are tracking this tool as ISMInjector. < https://unit42.paloaltonetworks.com/unit42-oilrig-group-steps-attacks-new-delivery-documents-new-injector-trojan/ >
	Jul 2017	The web server logs on the system we examined that was compromised with the TwoFace shell gave us a glimpse into the commands the actor executed through their malware. These commands also enabled us to create a profile of the actor, specifically their intentions and the tools and techniques used to carry out their operation. < https://unit42.paloaltonetworks.com/unit42-twoface-webshell-persistent-access-point-lateral-movement/ >
	Sep 2017	While expanding our research into the TwoFace webshell from this past July, we were able to uncover several IP addresses that logged in and directly interfaced with the shell we discovered and wrote about. Investigating deeper into these potential adversary IPs revealed a much larger infrastructure used to execute the attacks. < https://unit42.paloaltonetworks.com/unit42-striking-oil-closer-look-adversary-infrastructure/ >
	Nov 2017	New Targeted Attack in the Middle East In this latest campaign, APT34 leveraged the recent Microsoft Office vulnerability CVE-2017-11882 to deploy POWRUNER and BONDUPDATER. < https://www.fireeye.com/blog/threat-research/2017/12/targeted-attack-in-middle-east-by-apt34.html >
	Jan 2018	On January 8, 2018, Unit 42 observed the OilRig threat group carry out an attack on an insurance agency based in the Middle East. Just over a week later, on January 16, 2018, we observed an attack on a Middle Eastern financial institution. In both attacks, the OilRig group attempted to deliver a new Trojan that we are tracking as OopsIE. The January 8 attack used a variant of the ThreeDollars delivery document, which we identified as part of the OilRig toolset based on attacks that occurred in August 2017. < https://unit42.paloaltonetworks.com/unit42-oopsie-oilrig-uses-threedollars-deliver-new-trojan/ >
	Jan 2018	While investigating files uploaded to a TwoFace webshell, Unit 42 discovered actors installing an Internet Information Services (IIS) backdoor that we call RGDoor. Our data suggests that actors have deployed the RGDoor backdoor on web servers belonging to eight Middle Eastern government organizations, as well as one financial and one educational institution. < https://unit42.paloaltonetworks.com/unit42-oilrig-uses-rgdoor-iis-backdoor-targets-middle-east/ >
	May 2018	Technology Service Provider and Government Agency

		<p>Between May and June 2018, Unit 42 observed multiple attacks by the OilRig group appearing to originate from a government agency in the Middle East. Based on previously observed tactics, it is highly likely the OilRig group leveraged credential harvesting and compromised accounts to use the government agency as a launching platform for their true attacks.</p> <p><https://unit42.paloaltonetworks.com/unit42-oilrig-targets-technology-service-provider-government-agency-quadagent/></p>
Dec 2018	Shamoon v3	<p>After a two-year absence, the destructive malware Shamoon (W32.Distrack.B) re-emerged on December 10 in a new wave of attacks against targets in the Middle East. These latest Shamoon attacks are doubly destructive, since they involve a new wiper (Trojan.Filerase) that deletes files from infected computers before the Shamoon malware wipes the master boot record.</p> <p><https://www.symantec.com/blogs/threat-intelligence/shamoon-destructive-threat-re-emerges-new-sting-its-tail></p> <p><https://securingtomorrow.mcafee.com/other-blogs/mcafee-labs/shamoon-attackers-employ-new-tool-kit-to-wipe-infected-systems/></p>
Mar 2019		<p>In an incident reminiscent of the Shadow Brokers leak that exposed the NSA's hacking tools, someone has now published similar hacking tools belonging to one of Iran's elite cyber-espionage units, known as APT34, Oilrig, or HelixKitten.</p> <p><https://www.zdnet.com/article/source-code-of-iranian-cyber-espionage-tools-leaked-on-telegram/></p>
Jun 2019		<p>A new hacking tool believed to have been in the arsenal of Iranian state hackers has been published today online, in a Telegram channel.</p> <p>This new tool is named Jason and was published online earlier today in the same Telegram channel where the leaker – going by the name of Lab Dookhtegan – dumped the six other previous hacking tools.</p> <p><https://www.zdnet.com/article/new-iranian-hacking-tool-leaked-on-telegram/></p>
Jun 2019		<p>[W]e identified three new malware families and a reappearance of PICKPOCKET, malware exclusively observed in use by APT34. The new malware families, which we will examine later in this post, show APT34 relying on their PowerShell development capabilities, as well as trying their hand at Golang.</p> <p><https://www.fireeye.com/blog/threat-research/2019/07/hard-pass-declining-apt34-invite-to-join-their-professional-network.html></p>
Dec 2019		<p>New Destructive Wiper ZeroCleare Targets Energy Sector in the Middle East</p> <p><https://securityintelligence.com/posts/new-destructive-wiper-zeroclare-targets-energy-sector-in-the-middle-east/></p>
Jan 2020		<p>Our researchers Paul Litvak and Michael Kajilolti have discovered a new campaign conducted by APT34 employing an updated toolset. Based on uncovered phishing documents, we believe this Iranian actor is targeting Westat employees, or United States organizations hiring Westat services.</p>

		< https://intezer.com/blog-new-iranian-campaign-tailored-to-us-companies-uses-updated-toolset/ >
	Mar 2020	Karkoff 2020: a new APT34 espionage operation involves Lebanon Government < https://blog.yoroi.company/research/karkoff-2020-a-new-apt34-espionage-operation-involves-lebanon-government/ >

MITRE ATT&CK		< https://attack.mitre.org/groups/G0049/ >

Subgroup: Greenbug, Volatile Kitten

Names	Greenbug (Symantec) Volatile Kitten (CrowdStrike)	
Country	Iran	
Motivation	Information theft and espionage	
First seen	2016	
Description	<p>A subgroup of OilRig, APT 34, Helix Kitten, Chrysene.</p> <p>(Symantec) Symantec discovered the Greenbug cyberespionage group during its investigation into previous attacks involving W32.Distrack.B (aka Shamoon). Shamoon (W32.Distrack) first made headlines in 2012 when it was used in attacks against energy companies in Saudi Arabia. It recently resurfaced in November 2016 (W32.Distrack.B), again attacking targets in Saudi Arabia. While these attacks were covered extensively in the media, how the attackers stole these credentials and introduced W32.Distrack on targeted organizations' networks remains a mystery.</p> <p>Could Greenbug be responsible for getting Shamoon those stolen credentials?</p> <p>Although there is no definitive link between Greenbug and Shamoon, the group compromised at least one administrator computer within a Shamoon-targeted organization's network prior to W32.Distrack.B being deployed on November 17, 2016.</p>	
Operations performed	Nov 2016	Greenbug cyberespionage group targeting Middle East, possible links to Shamoon <https://www.symantec.com/connect/blogs/greenbug-cyberespionage-group-targeting-middle-east-possible-links-shamoon>
	May 2017	Researchers have identified a possible new collaborator in the continued Shamoon attacks against Saudi organizations. Called Greenbug, this group is believed to be instrumental in helping Shamoon steal user credentials of targets ahead of Shamoon's destructive attacks. <https://threatpost.com/shamoon-collaborator-greenbug-adopts-new-communication-tool/125383/>
	Jul 2017	OilRig Uses ISMDoor Variant; Possibly Linked to Greenbug Threat Group In July 2017, we observed an attack on a Middle Eastern technology organization that was also targeted by the OilRig campaign in August 2016. Initial inspection of this attack suggested this was again the OilRig campaign using their existing toolset, but further examination revealed not only new variants of the delivery document we named Clayslide, but also a different payload embedded inside it. <https://unit42.paloaltonetworks.com/unit42-oilrig-uses-ismdoor-variant-possibly-linked-greenbug-threat-group/>
	Oct 2017	Iranian Threat Agent Greenbug has been registering domains similar to those of Israeli High-Tech and Cyber Security Companies. On 15 October 2017 a sample of ISMdoor was submitted to VirusTotal from Iraq. <https://www.clearskysec.com/greenbug/>

OnionDog

Names	OnionDog (<i>Qihoo 360</i>)
Country	South Korea
Motivation	Information theft and espionage
First seen	2013
Description	<p>Seems to be a Cyber Drill that is conducted every year rather than an APT, according to findings from TrendMicro.</p> <p>(<i>Qihoo 360</i>) The Helios Team at 360 SkyEye Labs recently revealed that a hacker group named OnionDog has been infiltrating and stealing information from the energy, transportation and other infrastructure industries of Korean-language countries through the Internet. According to big data correlation analysis, OnionDog's first activity can be traced back to October, 2013 and in the following two years it was only active between late July and early September. The self-set life cycle of a Trojan attack is 15 days on average and is distinctly organizational and objective-oriented.</p> <p>OnionDog malware is transmitted by taking advantage of the vulnerability of the popular office software Hangul in Korean-language countries, and it attacked network-isolated targets through a USB Worm. In addition, OnionDog also used darkweb ("Onion City") communications tools, with which it can visit the domain without the Onion browser, making its real identity hidden in the completely anonymous Tor network.</p>
Observed	Sectors: Energy, Government, Transportation and Utilities. Countries: South Korea.
Tool used	Malware on a USB stick.
Information	< https://www.prnewswire.com/news-releases/onion-dog-a-3-year-old-apt-focused-on-the-energy-and-transportation-industries-in-korean-language-countries-is-exposed-by-360-300232441.html > < https://www.qianxin.com/assets/doc/apt_report/en/OPERATION%20ONIONDOG%20%E2%80%93Disclosing%20Targeted%20Attacks%20on%20Government.pdf > < https://blog.trendmicro.com/trendlabs-security-intelligence/oniondog-not-targeted-attack-cyber-drill/ >

Operation Black Atlas

Names	Operation Black Atlas (<i>Trend Micro</i>)
Country	[Unknown]
Motivation	Financial crime
First seen	2015
Description	<p>(<i>Trend Micro</i>) With the coming holidays also come news of various credit card breaches that endanger the data of many industries and their customers. High-profile breaches, such as that of the Hilton Hotel and other similar establishments, were accomplished using point-of-sale (PoS) malware, leading many to fear digital threats on brick-and-mortar retailers this Thanksgiving, Black Friday, Cyber Monday, and the rest of the holiday season. Researchers also found a broad campaign that uses the modular ModPOS malware to steal payment card data from retailers in the US.</p> <p>However, from what we have seen, it is not only retailers in the US that are at risk of breaches. Our researchers recently found an early version of a potentially powerful, adaptable, and invisible botnet that seeks out PoS systems within networks. It has already extended its reach to small and medium sized business networks all over the world, including a healthcare organization in the US. We are calling this operation Black Atlas, in reference to BlackPOS, the malware primarily used in this operation.</p> <p>Operation Black Atlas has been around since September 2015, just in time to plant its seeds before the holiday season. Its targets include businesses in the healthcare, retail, and more industries which rely on card payment systems.</p>
Observed	Countries: Australia, Chile, Germany, India, Taiwan, UK and USA. Sectors: Financial, Healthcare, Hospitality, Manufacturing and Retail.
Tools used	Alina POS, BlackPOS, Gorynych, ModPOS and NewPosThings.
Information	< https://blog.trendmicro.com/trendlabs-security-intelligence/operation-black-atlas-endangers-in-store-card-payments-and-smbs-worldwide-switches-between-blackpos-and-other-tools/ > < https://blog.trendmicro.com/trendlabs-security-intelligence/operation-black-atlas-part-2-tools-and-malware-used-and-how-to-detect-them/ >

Operation BugDrop

Names	Operation BugDrop (<i>CyberX</i>)
Country	Russia
Motivation	Information theft and espionage
First seen	2016
Description	<p>(CyberX) CyberX has discovered a new, large-scale cyber-reconnaissance operation targeting a broad range of targets in the Ukraine. Because it eavesdrops on sensitive conversations by remotely controlling PC microphones – in order to surreptitiously “bug” its targets – and uses Dropbox to store exfiltrated data, CyberX has named it “Operation BugDrop.”</p> <p>CyberX has confirmed at least 70 victims successfully targeted by the operation in a range of sectors including critical infrastructure, media, and scientific research. The operation seeks to capture a range of sensitive information from its targets including audio recordings of conversations, screen shots, documents and passwords. Unlike video recordings, which are often blocked by users simply placing tape over the camera lens, it is virtually impossible to block your computer’s microphone without physically accessing and disabling the PC hardware.</p>
Observed	Sectors: Engineering, Oil and gas, Media and Research. Countries: Austria, Saudi Arabia, Russia and Ukraine.
Tool used	Dropbox.
Information	< https://cyberx-labs.com/blog/operation-bugdrop-cyberx-discovers-large-scale-cyber-reconnaissance-operation/ >

Operation DRBControl

Names	Operation DRBControl (<i>Trend Micro</i>)
Country	China
Motivation	Information theft and espionage
First seen	2019
Description	<p>(<i>Trend Micro</i>) In the summer of 2019, Talent-Jump Technologies, Inc. contacted Trend Micro regarding a backdoor that they discovered after performing an incident response operation on a company based in the Philippines. Trend Micro provided further intelligence and context on this particular backdoor. An in-depth analysis revealed that the backdoor was being used by an advanced persistent threat (APT) actor that we dubbed “DRBControl,” as we could not find anything related to the group in our databases or public malware repositories.</p> <p>Our analysis also found that the threat actor uses a number of additional backdoors and post-exploitation tools, as well as some spear-phishing documents that could have been used during the initial phase of a related campaign. One of the backdoors was of particular interest, as it used the file hosting service Dropbox as a command-and-control (C&C) channel. We shared our analysis with Dropbox, which has since been working with Trend Micro regarding the issues.</p> <p>We observed that the threat actor behind this campaign had very specific targets, as it only goes after gambling and betting companies in Southeast Asia. We have been made aware that Europe and the Middle East regions are also being targeted, but we could not confirm this information at the time of writing. The exfiltrated data was mostly comprised of databases and source codes, which leads us to believe that the campaign is used for cyberespionage or gaining competitive intelligence. Some of the backdoors were unknown to us, which could suggest that it is a previously unreported group. However, we also managed to link it to some known threat actors.</p> <p>Could be related to APT 41 and/or Emissary Panda, APT 27, LuckyMouse, Bronze Union.</p>
Observed	Sectors: Gambling and betting. Countries: Philippines and Southeast Asia.
Tool used	Cobalt Strike, CLAMBLING, Dropbox, EarthWorm, HyperBro, MFC Keyloggers, Mimikatz, nbtscan, NetPwdDump, NetUseEngine, PlugX, pwdump, Trochilus RAT and Winnti.
Information	< https://documents.trendmicro.com/assets/white_papers/wp-uncovering-DRBcontrol.pdf >

Operation Comando

Names	Operation Comando (<i>Palo Alto</i>)
Country	[Unknown]
Motivation	Financial crime
First seen	2018
Description	<p>(<i>Palo Alto</i>) In December 2018, Palo Alto Networks Unit 42 researchers identified an ongoing campaign with a strong focus on the hospitality sector, specifically on hotel reservations. Although our initial analysis didn't show any novel or advanced techniques, we did observe strong persistence during the campaign that triggered our curiosity.</p> <p>We followed network traces and pivoted on the information left behind by this actor, such as open directories, document metadata, and binary peculiarities, which enabled us to find a custom-made piece of malware, that we named "CapturaTela". Our discovery of this malware family shows the reason for the persistent focus on hotel reservations as a primary vector: stealing credit card information from customers.</p> <p>We profiled this threat actor and that has resulted in uncovering not only their delivery mechanisms, but also their arsenal of remote access tools and info-stealing 232rojans, both acquired from underground forums as well as open source tools found in GitHub repositories.</p>
Observed	Sectors: Hospitality, specifically on hotel reservations. Countries: Brazil.
Tools used	AsyncRAT, CapturaTela, LimeRAT, NanoCore RAT, njRAT, RemcosRAT and RevengeRAT.
Information	< https://unit42.paloaltonetworks.com/operation-comando-or-how-to-run-a-cheap-and-effective-credit-card-business/ >

Operation Ghoul

Names	Operation Ghoul (<i>Kaspersky</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2016
Description	<p>(Kaspersky) Kaspersky Lab has observed new waves of attacks that started on the 8th and the 27th of June 2016. These have been highly active in the Middle East region and unveiled ongoing targeted attacks in multiple regions. The attackers try to lure targets through spear phishing emails that include compressed executables. The malware collects all data such as passwords, keystrokes and screenshots, then sends it to the attackers.</p> <p>We found that the group behind this campaign targeted mainly industrial, engineering and manufacturing organizations in more than 30 countries. In total, over 130 organizations have been identified as victims of this campaign. Using the Kaspersky Security Network (KSN) and artifacts from malware files and attack sites, we were able to trace the attacks back to March 2015. Noteworthy is that since the beginning of their activities, the attackers' motivations are apparently financial, whether through the victims' banking accounts or through selling their intellectual property to interested parties, most infiltrated victim organizations are considered SMBs (Small to Medium size businesses, 30-300 employees), the utilization of commercial off-the-shelf malware makes the attribution of the attacks more difficult.</p>
Observed	Sectors: Education, Engineering, Industrial, Manufacturing, IT, Pharmaceutical, Shipping and Logistics, Tourism and Trading. Countries: Azerbaijan, China, Egypt, France, Germany, Gibraltar, India, Iran, Iraq, Italy, Pakistan, Portugal, Romania, Qatar, Saudi Arabia, Spain, Sweden, Switzerland, Taiwan, Turkey, UAE, UK and USA.
Tool used	OpGhoul.
Information	< https://securelist.com/operation-ghoul-targeted-attacks-on-industrial-and-engineering-organizations/75718/ >

Operation Groundbait

Names	Operation Groundbait (<i>ESET</i>)
Country	Ukraine
Motivation	Information theft and espionage
First seen	2008
Description	<p>(<i>ESET</i>) After BlackEnergy, which has, most infamously, facilitated attacks that resulted in power outages for hundreds of thousands of Ukrainian civilians, and Operation Potao Express where attackers went after sensitive TrueCrypt-protected data from high value targets, ESET researchers have uncovered another cyberespionage operation in Ukraine: Operation Groundbait.</p> <p>The main point that sets Operation Groundbait apart from the other attacks is that it has mostly been targeting anti-government separatists in the self-declared Donetsk and Luhansk People's Republics.</p> <p>While the attackers seem to be more interested in separatists and the self-declared governments in eastern Ukrainian war zones, there have also been a large number of other targets, including, among others, Ukrainian government officials, politicians and journalists.</p>
Observed	Sectors: Government, politicians and journalists. Countries: Ukraine.
Tool used	Prikormka.
Information	< https://www.welivesecurity.com/2016/05/18/groundbait/ >

Operation HangOver, Monsoon, Viceroy Tiger

Names	Operation HangOver (<i>Shadowserver Foundation</i>) Monsoon (<i>Forcepoint</i>) Viceroy Tiger (<i>CrowdStrike</i>) Neon	
Country	India	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(Shadowserver Foundation) On Sunday March 17th 2013 the Norwegian newspaper Aftenposten reported that the telecommunications giant Telenor had filed a case with Norwegian criminal police ("KRIPOS") over what was perceived as an unlawful intrusion into their computer network. The infection was reported to have been conducted via "spear phishing" emails sent to people in the upper tiers of management.</p> <p>Initially, we had no information or visibility into this case. However, after some time Norwegian CERT (NorCERT) shared some data from the event, which included md5 hashes of malicious files and information about which Command and Control servers were used.</p> <p>However, the data we were given acted as a starting point for more data mining, and within a short period of time it became obvious that we were seeing a previously unknown and very extensive infrastructure for targeted attacks. This paper is the result of the ensuing investigation.</p> <p>The samples we have uncovered seem to have been created from approximately September 2010 until the present day. It appears 2012 was a very active year for this group, which saw escalation not only in numbers of created malware files but also in targets. There is no sign that the attacks will slow down in 2013, as we see new attacks continuously.</p> <p>In a great number of isolated cases and contexts, the word "Appin" shows up and there seems to be some connection with the Indian security company called Appin Security Group.</p>	
Observed	Sectors: Defense, Government, Hospitality and Telecommunications. Countries: Austria, Bangladesh, Canada, China, France, Germany, India, Indonesia, Iran, Jordan, Norway, Oman, Panama, Pakistan, Poland, Romania, Russia, Singapore, Sri Lanka, Taiwan, Thailand, UK, USA, Africa and Far East.

Operation Olympic Games

Names	Operation Olympic Games (<i>self given</i>) GOSSIPGIRL
Country	USA and Israel
Sponsor	State-sponsored, Equation Group (NSA), CIA and Unit 8200
Motivation	Sabotage and destruction
First seen	2010
Description	<p>(The New York Times) From his first months in office, President Obama secretly ordered increasingly sophisticated attacks on the computer systems that run Iran's main nuclear enrichment facilities, significantly expanding America's first sustained use of cyberweapons, according to participants in the program.</p> <p>Mr. Obama decided to accelerate the attacks — begun in the Bush administration and code-named Olympic Games — even after an element of the program accidentally became public in the summer of 2010 because of a programming error that allowed it to escape Iran's Natanz plant and sent it around the world on the Internet. Computer security experts who began studying the worm, which had been developed by the United States and Israel, gave it a name: Stuxnet.</p>
Observed	Sectors: Energy. Countries: Iran.
Tools used	Stuxnet.
Information	< https://www.nytimes.com/2012/06/01/world/middleeast/obama-ordered-wave-of-cyberattacks-against-iran.html > < https://news.yahoo.com/revealed-how-a-secret-dutch-mole-aided-the-us-israeli-stuxnet-cyber-attack-on-iran-160026018.html >

Operation Parliament

Names	Operation Parliament (Kaspersky)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2017
Description	<p>(Kaspersky) Based on our findings, we believe the attackers represent a previously unknown geopolitically motivated threat actor. The campaign started in 2017, with the attackers doing just enough to achieve their goals. They most likely have access to additional tools when needed and appear to have access to an elaborate database of contacts in sensitive organizations and personnel worldwide, especially of vulnerable and non-trained staff. The victim systems range from personal desktop or laptop systems to large servers with domain controller roles or similar. The nature of the targeted ministries varied, including those responsible for telecommunications, health, energy, justice, finance and so on.</p> <p>Operation Parliament appears to be another symptom of escalating tensions in the Middle East region. The attackers have taken great care to stay under the radar, imitating another attack group in the region. They have been particularly careful to verify victim devices before proceeding with the infection, safeguarding their command and control servers. The targeting seems to have slowed down since the beginning of 2018, probably winding down when the desired data or access was obtained. The targeting of specific victims is unlike previously seen behavior in regional campaigns by Gaza Cybergang or Desert Falcons and points to an elaborate information-gathering exercise that was carried out before the attacks (physical and/or digital).</p> <p>With deception and false flags increasingly being employed by threat actors, attribution is a hard and complicated task that requires solid evidence, especially in complex regions such as the Middle East.</p> <p>An overlap has been found between Operation Parliament and Molerats, Extreme Jackal, Gaza Cybergang.</p>
Observed	Sectors: Defense, Education, Energy, Financial, Government, Healthcare, Media, Research, Shipping and Logistics, Sports and Telecommunications. Countries: Afghanistan, Canada, Chile, Denmark, Djibouti, Egypt, Germany, India, Iran, Iraq, Israel, Jordan, Kuwait, Lebanon, Morocco, Oman, Palestine, Qatar, Russia, Saudi Arabia, Serbia, Somalia, South Korea, Syria, UAE, UK and USA.
Tool used	Remote CMD/PowerShell terminal.
Information	https://securelist.com/operation-parliament-who-is-doing-what/85237/ https://blog.talosintelligence.com/2018/02/targeted-attacks-in-middle-east.html

Operation Poisoned News, TwoSail Junk

Names	Operation Poisoned News (<i>Trend Micro</i>) TwoSail Junk (<i>Kaspersky</i>)
Country	China
Motivation	Information theft and espionage
First seen	2020
Description	<p>(Kaspersky) A watering hole was discovered on January 10, 2020 utilizing a full remote iOS exploit chain to deploy a feature-rich implant named LightSpy. The site appears to have been designed to target users in Hong Kong based on the content of the landing page. Since the initial activity, we released two private reports exhaustively detailing spread, exploits, infrastructure and LightSpy implants.</p> <p>We are temporarily calling this APT group “TwoSail Junk”. Currently, we have hints from known backdoor callbacks to infrastructure about clustering this campaign with previous activity. And we are working with colleagues to tie LightSpy with prior activity from a long running Chinese-speaking APT group, previously reported on as Lotus Blossom, Spring Dragon, Thrip, known for their Lotus Elise and Evora backdoor malware. Considering that this LightSpy activity has been disclosed publicly by our colleagues from TrendMicro, we would like to further contribute missing information to the story without duplicating content. And, in our quest to secure technologies for a better future, we reported the malware and activity to Apple and other relevant companies.</p>
Observed	Countries: Hong Kong.

Information	< https://securelist.com/ios-exploit-chain-deploys-lightspy-malware/96407/ > < https://documents.trendmicro.com/assets/Tech-Brief-Operation-Poisoned-News-Hong-Kong-Users-Targeted-with-Mobile-Malware-via-Local-News-Links.pdf >

Operation Poison Needles

Names	Operation Poison Needles (<i>Qihoo 360</i>)
Country	Ukraine
Motivation	Information theft and espionage
First seen	2018
Description	(<i>Qihoo 360</i>) On the evening of November 29, 2018, shortly after the break-out of the Kerch Strait Incident, 360 Advanced Threat Response Team was the first security team to discover the APT attack against the FSB “Polyclinic No.2” affiliated to the Presidential Administration of Russia. The lure document used to initiate the attack was a carefully forged employee questionnaire, which exploited the latest Flash 0day vulnerability CVE-2018-15982 and a customized Trojan with self-destruction function. All the technical details indicate that the APT group is determined to compromise the target at any price, but at the same time, it is also very cautious.
Observed	Sectors: Healthcare. Countries: Russia.
Tool used	0-day Flash exploit.
Information	< http://blogs.360.cn/post/PoisonNeedles_CVE-2018-15982_EN >

Operation Potao Express

Names	Operation Potao Express (<i>ESET</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2015
Description	<p>(<i>ESET</i>) We presented our initial findings based on research into the Win32/Potao malware family in June, in our CCCC 2015 presentation in Copenhagen. Today, we are releasing the full whitepaper on the Potao malware with additional findings, the cyberespionage campaigns where it was employed, and its connection to a backdoor in the form of a modified version of the TrueCrypt encryption software.</p> <p>Like BlackEnergy, the malware used by the so-called Sandworm APT group (also known as Quedagh), Potao is an example of targeted espionage malware directed mostly at targets in Ukraine and a number of other post-Soviet countries, including Russia, Georgia and Belarus.</p>
Observed	Countries: Belarus, Georgia, Russia and Ukraine.
Tool used	FakeTC and Patao.
Information	< https://www.welivesecurity.com/wp-content/uploads/2015/07/Operation-Potao-Express_final_v2.pdf >

Operation Red Signature

Names	Operation Red Signature (<i>Trend Micro</i>)
Country	China
Motivation	Information theft and espionage
First seen	2018
Description	<p>(Trend Micro) Together with our colleagues at IssueMakersLab, we uncovered Operation Red Signature, an information theft-driven supply chain attack targeting organizations in South Korea. We discovered the attacks around the end of July, while the media reported the attack in South Korea on August 6.</p> <p>The threat actors compromised the update server of a remote support solutions provider to deliver a remote access tool called 9002 RAT to their targets of interest through the update process. They carried this out by first stealing the company's certificate then using it to sign the malware. They also configured the update server to only deliver malicious files if the client is located in the range of IP addresses of their target organizations.</p> <p>9002 RAT also installed additional malicious tools: an exploit tool for Internet Information Services (IIS) 6 WebDav (exploiting CVE-2017-7269) and an SQL database password dumper. These tools hint at how the attackers are also after data stored in their target's web server and database.</p>
Observed	Countries: South Korea.
Tool used	9002 RAT.
Information	< https://blog.trendmicro.com/trendlabs-security-intelligence/supply-chain-attack-operation-red-signature-targets-south-korean-organizations/ >

Operation Shady RAT

Names	Operation Shady RAT (<i>McAfee</i>)
Country	China
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2006
Description	<p>(McAfee) With the goal of raising the level of public awareness today we are publishing the most comprehensive analysis ever revealed of victim profiles from a five year targeted operation by one specific actor—Operation Shady RAT, as I have named it at McAfee (RAT is a common acronym in the industry which stands for Remote Access Tool).</p> <p>This is not a new attack, and the vast majority of the victims have long since remediated these specific infections (although whether most realized the seriousness of the intrusion or simply cleaned up the infected machine without further analysis into the data loss is an open question). McAfee has detected the malware variants and other relevant indicators for years with Generic Downloader.x and Generic BackDoor.t heuristic signatures (those who have had prior experience with this specific adversary may recognize it by the use of encrypted HTML comments in web pages that serve as a command channel to the infected machine).</p> <p>McAfee has gained access to one specific Command & Control server used by the intruders. We have collected logs that reveal the full extent of the victim population since mid-2006 when the log collection began. Note that the actual intrusion activity may have begun well before that time but that is the earliest evidence we have for the start of the compromises. The compromises themselves were standard procedure for these types of targeted intrusions: a spear-phishing email containing an exploit is sent to an individual with the right level of access at the company, and the exploit when opened on an unpatched system will trigger a download of the implant malware. That malware will execute and initiate a backdoor communication channel to the Command & Control web server and interpret the instructions encoded in the hidden comments embedded in the webpage code. This will be quickly followed by live intruders jumping on to the infected machine and proceeding to quickly escalate privileges and move laterally within the organization to establish new persistent footholds via additional compromised machines running implant malware, as well as targeting for quick exfiltration the key data they came for.</p>
Observed	<p>Sectors: Energy, Government, Industrial, IT, Media, Telecommunications, Think Tanks, Non-profit organizations.</p> <p>Countries: Canada, Denmark, Germany, Hong Kong, India, Indonesia, Japan, Singapore, South Korea, Switzerland, Taiwan, UK, USA and Vietnam.</p>

Operation Titan Rain

Names	Operation Titan Rain (<i>US Government</i>)
Country	China
Sponsor	State-sponsored, PLA Unit 61398
Motivation	Information theft and espionage
First seen	2003
Description	(Kaspersky) Hacks against the Defense Department and other U.S. agencies stretching back to 2003 were codenamed Titan Rain by investigators. The attacks, which breached hundreds of networks, including Departments of State, Energy and Homeland Security, were coordinated from Chinese computers, investigators found. Global defense contractor Lockheed Martin and NASA were also struck in what many experts called an attempt to glean information on U.S. systems. While it's usually difficult to locate the country of origin for such attacks, researchers were able to trace them back to the Chinese province of Guangdong. However, the individuals behind the operation remain a mystery to this day.
Observed	Sectors: Defense, Energy and Government. Countries: UK and USA.

Operation ViceLeaker

Names	Operation ViceLeaker (<i>Kaspersky</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2018
Description	<p>(Kaspersky) In May 2018, we discovered a campaign targeting dozens of mobile Android devices belonging to Israeli citizens. Kaspersky spyware sensors caught the signal of an attack from the device of one of the victims; and a hash of the APK involved (Android application) was tagged in our sample feed for inspection. Once we looked into the file, we quickly found out that the inner-workings of the APK included a malicious payload, embedded in the original code of the application. This was an original spyware program, designed to exfiltrate almost all accessible information.</p> <p>During the course of our research, we noticed that we were not the only ones to have found the operation. Researchers from Bitdefender also released an analysis of one of the samples in a blogpost. Although something had already been published, we decided to do something different with the data we acquired. The following month, we released a private report on our Threat Intelligence Portal to alert our clients about this newly discovered operation and began writing YARA rules in order to catch more samples. We decided to call the operation "ViceLeaker", because of strings and variables in its code.</p>
Observed	Sectors: Citizens. Countries: Israel.
Tool used	ViceLeaker.

Operation WizardOpium

Names	Operation WizardOpium (Kaspersky)
Country	North Korea
Motivation	Information theft and espionage
First seen	2019
Description	<p>(Kaspersky) Kaspersky Exploit Prevention is a component part of Kaspersky products that has successfully detected a number of zero-day attacks in the past. Recently, it caught a new unknown exploit for Google's Chrome browser. We promptly reported this to the Google Chrome security team. After reviewing of the PoC we provided, Google confirmed there was a zero-day vulnerability and assigned it CVE-2019-13720.</p> <p>We are calling these attacks Operation WizardOpium. So far, we have been unable to establish a definitive link with any known threat actors. There are certain very weak code similarities with Lazarus Group, Hidden Cobra, Labyrinth Chollima attacks, although these could very well be a false flag. The profile of the targeted website is more in line with earlier DarkHotel attacks that have recently deployed similar false flag attacks.</p>
Observed	Countries: South Korea.

Orangeworm

Names	Orangeworm (<i>Symantec</i>)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2015	
Description	<p>(<i>Symantec</i>) Symantec has identified a previously unknown group called Orangeworm that has been observed installing a custom backdoor called Trojan.Kwampirs within large international corporations that operate within the healthcare sector in the United States, Europe, and Asia.</p> <p>First identified in January 2015, Orangeworm has also conducted targeted attacks against organizations in related industries as part of a larger supply-chain attack in order to reach their intended victims. Known victims include healthcare providers, pharmaceuticals, IT solution providers for healthcare and equipment manufacturers that serve the healthcare industry, likely for the purpose of corporate espionage.</p> <p>Based on the list of known victims, Orangeworm does not select its targets randomly or conduct opportunistic hacking. Rather, the group appears to choose its targets carefully and deliberately, conducting a good amount of planning before launching an attack.</p> <p>According to Symantec telemetry, almost 40 percent of Orangeworm's confirmed victim organizations operate within the healthcare industry. The Kwampirs malware was found on machines which had software installed for the use and control of high-tech imaging devices such as X-Ray and MRI machines. Additionally, Orangeworm was observed to have an interest in machines used to assist patients in completing consent forms for required procedures. The exact motives of the group are unclear.</p>	
Observed	<p>Sectors: Food and Agriculture, Healthcare, IT, Manufacturing and Shipping and Logistics.</p> <p>Countries: Belgium, Brazil, Canada, Chile, China, France, Germany, Hong Kong, Hungary, India, Malaysia, Netherlands, Norway, Philippines, Poland, Saudi Arabia, Spain, Sweden, Switzerland, Turkey, UK and USA.</p>	
Tools used	Kwampirs and Loving off the Land.	
Operations performed	Jan 2020	The FBI has issued an alert on Monday about state-sponsored hackers using the Kwampirs malware to attack supply chain companies and other industry sectors as part of a global hacking campaign. https://www.zdnet.com/article/fbi-re-sends-alert-about-supply-chain-attacks-for-the-third-time-in-three-months/

Packrat

Names	Packrat (<i>Citizen Lab</i>)
Country	[Latin America]
Motivation	Information theft and espionage
First seen	2008
Description	<p>(Citizen Lab) This report describes an extensive malware, phishing, and disinformation campaign active in several Latin American countries, including Ecuador, Argentina, Venezuela, and Brazil. The nature and geographic spread of the targets seems to point to a sponsor, or sponsors, with regional, political interests. The attackers, whom we have named Packrat, have shown a keen and systematic interest in the political opposition and the independent press in so-called ALBA countries (Bolivarian Alternative for the Americas), and their recently allied regimes. These countries are linked by a trade agreement as well as a cooperation on a range of non-financial matters.</p> <p>After observing a wave of attacks in Ecuador in 2015, we linked these attacks to a campaign active in Argentina in 2014. The targeting in Argentina was discovered when the attackers attempted to compromise the devices of Alberto Nisman and Jorge Lanata. Building on what we had learned about these two campaigns, we then traced the group's activities back as far as 2008.</p> <p>This report brings together many of the pieces of this campaign, from malware and phishing, to command and control infrastructure spread across Latin America. It also highlights fake online organizations that Packrat has created in Venezuela and Ecuador. Who is responsible? We assess several scenarios, and consider the most likely to be that Packrat is sponsored by a state actor or actors, given their apparent lack of concern about discovery, their targets, and their persistence. However, we do not conclusively attribute Packrat to a particular sponsor.</p>
Observed	Sectors: Government, Media and high profile political figures, journalists, and others. Countries: Argentina, Brazil, Ecuador and Venezuela.
Tool used	Adzok, AlienSpy, CyberGate RAT and XtremeRAT.
Information	< https://citizenlab.ca/2015/12/packrat-report/ >

Parosite, Fox Kitten

Names	Parosite (<i>Dragos</i>) Fox Kitten (<i>ClearSky</i>)	
Country	Iran	
Motivation	Information theft and espionage	
First seen	2017	
Description	<p>“This group has operated since at least 2017 based on infrastructure Dragos identified,” the report explained. “Parosite serves as the initial access group and enables further operations for APT 33, Elfin, Magnallium. ”</p> <p>(<i>ClearSky</i>) During the last quarter of 2019, ClearSky research team has uncovered a widespread Iranian offensive campaign which we call “Fox Kitten Campaign”; this campaign is being conducted in the last three years against dozens of companies and organizations in Israel and around the world. Though the campaign, the attackers succeeded in gaining access and persistent foothold in the networks of numerous companies and organizations from the IT, Telecommunication, Oil and Gas, Aviation, Government, and Security sectors around the world.</p> <p>During our analysis, we have found an overlap, with medium-high probability, between this campaign’s infrastructure and the activity of an Iranian offensive group OilRig, APT 34, Helix Kitten, Chrysene. Additionally, we have identified, with medium probability, a connection between this campaign and the APT 33, Elfin, Magnallium and Chafer, APT 39 groups. The campaign was first revealed by Dragos, named “Parosite” and attributed to APT33; we call the comprehensive campaign revealed in this report “Fox Kitten”.</p> <p>The initial breach of the targeted organizations was performed, in most cases, by exploiting 1-day vulnerabilities in different VPN services such as: Pulse Secure VPN, Fortinet VPN, and Global Protect by Palo Alto Networks. Upon gaining foothold at the target, the attackers tried to maintain the access to the networks by opening a variety of communication tools, including opening RDP links over SSH tunneling, in order to camouflage and encrypt the communication with the targets. At the final stage, after successfully infiltrating the organization, the attackers have performed a routine process of identification, examination, and filtering of sensitive, valuable information from every targeted organization. The valuable information was sent back to the attackers for reconnaissance, espionage, or further infection of connected networks.</p>	
Observed	<p>Sectors: Aviation, Energy, Defense, Government, IT, Oil and gas and Telecommunications.</p> <p>Countries: Australia, Austria, Finland, France, Germany, Hungary, Israel, Italy, Kuwait, Lebanon, Malaysia, Poland, Saudi Arabia, UAE and USA.</p>

PassCV

Names	PassCV (<i>Blue Coat Systems</i>)
Country	China
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2016
Description	<p>(Cylance) Snorre Fagerland of Blue Coat Systems first coined the term PassCV in a blog post. His post provides a good introduction to the group and covers some of the older infrastructure, stolen code-signing certificate reuse, and other connections associated with the PassCV malware. There are several clues alluding to the possibility that multiple groups may be utilizing the same stolen signing certificates, but at this time SPEAR believes the current attacks are more likely being perpetrated by a single group employing multiple publicly available Remote Administration Tools (RATs).</p> <p>The PassCV group has been operating with continued success and has already started to expand their malware repertoire into different off-the-shelf RATs and custom code. SPEAR identified eighteen previously undisclosed stolen Authenticode certificates. These certificates were originally issued to companies and individuals scattered across China, Taiwan, Korea, Europe, the United States and Russia.</p> <p>The PassCV group typically utilized publicly available RATs in addition to some custom code, which ultimately provided backdoor functionality to affected systems via phony resumes and curriculum vitae (CVs). PassCV continues to maintain a heavy reliance on obfuscated and signed versions of older RATs like ZxShell and Ghost RAT, which have remained a favorite of the wider Chinese criminal community since their initial public release.</p>
Observed	Sectors: Online video game companies. Countries: China, Europe, Russia, South Korea, Taiwan and USA.
Tools used	Cobalt Strike, Excalibur, Gh0st RAT, Kitkot, NetWire RC, Winnti and ZXShell.
Information	< https://threatvector.cylance.com/en_us/home/digitally-signed-malware-targeting-gaming-companies.html >

Patchwork, Dropping Elephant

Names	Patchwork (<i>Cymmetria</i>) Dropping Elephant (<i>Kaspersky</i>) Chinastrats (<i>Kaspersky</i>) APT-C-09 (<i>Qihoo 360</i>) Quilted Tiger (<i>CrowdStrike</i>) ATK 11 (<i>Thales</i>)	
Country	India	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(<i>Cymmetria</i>) Patchwork is a targeted attack that has infected an estimated 2,500 machines since it was first observed in December 2015. There are indications of activity as early as 2014, but Cymmetria has not observed any such activity first hand.</p> <p>Patchwork targets were chosen worldwide with a focus on personnel working on military and political assignments, and specifically those working on issues relating to Southeast Asia and the South China Sea. Many of the targets were governments and government-related organizations.</p> <p>The code used by this threat actor is copy-pasted from various online forums, in a way that reminds us of a patchwork quilt –hence the name we've given the operation.</p> <p>In active victim systems, Patchwork immediately searches for and uploads documents to their C&C, and only if the target is deemed valuable enough, proceeds to install a more advanced second stage malware.</p> <p>This group seems to be associated with Confucius.</p>	
Observed	<p>Sectors: Aviation, Defense, Energy, Financial, Government, IT, Media, NGOs, Pharmaceutical and Think Tanks.</p> <p>Countries: China, Israel, Japan, Middle East, UK, USA, Southeast Asia and South Korea, many of the target countries are in the area surrounding the Indian subcontinent (Bangladesh, Sri Lanka and Pakistan).</p>	
Tools used	AndroRAT, ArtraDownloader, Autolt backdoor, BADNEWS, Bahamut, NDiskMonitor, PowerSploit, QuasarRAT, SocksBot, TINYTYPHON, Unknown Logger and WSCSPL.	
Operations performed	2015	<p>The attack was detected as part of a spear phishing against a government organization in Europe in late May 2016. The target was an employee working on Chinese policy research and the attack vector was a PowerPoint presentation file. The content of the presentation was on issues relating to Chinese activity in the South China Sea.</p> <p><https://s3-us-west-2.amazonaws.com/cymmetria-blog/public/Unveiling_Patchwork.pdf></p>
	Jan 2018	<p>The malicious documents seen in recent activity refer to a number of topics, including recent military promotions within the Pakistan Army, information related to the Pakistan Atomic Energy Commission, as well as Pakistan's Ministry of the Interior.</p> <p><https://unit42.paloaltonetworks.com/unit42-patchwork-continues-deliver-badnews-indian-subcontinent/></p>

	Mar 2018	<p>Targeting US Think Tanks</p> <p>In March and April 2018, Volexity identified multiple spear phishing campaigns attributed to Patchwork, an Indian APT group also known as Dropping Elephant. This increase in threat activity was consistent with other observations documented over the last few months in blogs by 360 Threat Intelligence Center analyzing attacks on Chinese organizations and Trend Micro noting targets in South Asia.</p> <p><https://www.volexity.com/blog/2018/06/07/patchwork-apt-group-targets-us-think-tanks/></p>

PittyTiger, Pitty Panda

Names	PittyTiger (<i>FireEye</i>) Pitty Panda (<i>CrowdStrike</i>) Manganese (<i>Microsoft</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(<i>Airbus</i>) Pitty Tiger is a group of attackers that have been active since at least 2011. They have targeted private companies in several sectors, such as defense and telecommunications, but also at least one government.</p> <p>We have been able to track down this group of attackers and can provide detailed information about them. We were able to collect and reveal their “malware arsenal”. We also analyzed their technical organization.</p> <p>Our investigations indicate that Pitty Tiger has not used any 0day vulnerability so far, rather they prefer using custom malware, developed for the group’s exclusive usage. Our discoveries indicate that Pitty Tiger is a group of attackers with the ability to stay under the radar, yet still not as mature as other groups of attackers we monitor.</p> <p>Pitty Tiger is probably not a state-sponsored group of attackers. They lack the experience and financial support that one would expect from state-sponsored attackers. We suppose this group is opportunistic and sells its services to probable competitors of their targets in the private sector.</p> <p>We have been able to leverage several attackers profiles, showing that the Pitty Tiger group is fairly small compared to other APT groups, which is probably why we saw them work on a very limited amount of targets.</p> <p>There is some overlap with APT 5, Keyhole Panda.</p>	
Observed	Sectors: Defense, Government, Telecommunications and Web development. Countries: Europe and Taiwan.	
Tools used	Enfal, Gh0st RAT, gsecdump, Leo RAT, Mimikatz, Paladin RAT, pgift, Pitty and Poison Ivy.	
Operations performed	2011	Operation “The Eye of the Tiger” https://paper.seebug.org/papers/APT/APT_CyberCriminal_Campagin/2014/2014.07.11.Pitty_Tiger/Pitty_Tiger_Final_Report.pdf
	Jun 2014	We discovered this malware sample in June 2014, leading to a command & control (c&c) server still in activity. Our researches around the malware family revealed the “Pitty Tiger” group has been active since 2011, yet we found traces which makes us believe the group is active since 2010. http://blog.cassidiancybersecurity.com/post/2014/07/The-Eye-of-the-Tiger2
	Jul 2014	During the last month, McAfee Labs researchers have uncovered targeted attacks carried out via spear phishing email against a French

		company. We have seen email sent to a large group of individuals in the organization. < https://securingtomorrow.mcafee.com/other-blogs/mcafee-labs/targeted-attacks-on-french-company-exploit-multiple-word-vulnerabilities/ >
2014		In a recent attack against a French company, the attackers sent simple, straightforward messages in English and French from free email addresses using names of actual employees of the targeted company. < https://www.fireeye.com/blog/threat-research/2014/07/spy-of-the-tiger.html >
MITRE ATT&CK	< https://attack.mitre.org/groups/G0011/ >	

PKPLUG

Names	PKPLUG (<i>Palo Alto</i>)
Country	China
Motivation	Information theft and espionage
First seen	2016
Description	(Palo Alto) For three years, Unit 42 has tracked a set of cyber espionage attack campaigns across Asia, which used a mix of publicly available and custom malware. Unit 42 created the moniker “PKPLUG” for the threat actor group, or groups, behind these and other documented attacks referenced later in this report. We say group or groups as our current visibility doesn’t allow us to determine with high confidence if this is the work of one group, or more than one group which uses the same tools and has the same tasking. The name comes from the tactic of delivering PlugX malware inside ZIP archive files as part of a DLL side-loading package. The ZIP file format contains the ASCII magic-bytes “PK” in its header, hence PKPLUG.
Observed	Sectors: Government and Healthcare. Countries: China, Indonesia, Mongolia, Myanmar, Taiwan, Tibet and Vietnam.
Tools used	9002 RAT, Farseer, HenBox, PlugX, Poison Ivy and Zupdax.

Platinum

Names	Platinum (<i>Microsoft</i>) TwoForOne (<i>FireEye</i>) ATK 33 (<i>Thales</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2009	
Description	<p>(Microsoft) Platinum has been targeting its victims since at least as early as 2009, and may have been active for several years prior. Its activities are distinctly different not only from those typically seen in untargeted attacks, but from many targeted attacks as well. A large share of targeted attacks can be characterized as opportunistic: the activity group changes its target profiles and attack geographies based on geopolitical seasons, and may attack institutions all over the world. Like many such groups, Platinum seeks to steal sensitive intellectual property related to government interests, but its range of preferred targets is consistently limited to specific governmental organizations, defense institutes, intelligence agencies, diplomatic institutions, and telecommunication providers in South and Southeast Asia. The group's persistent use of spear-phishing tactics (phishing attempts aimed at specific individuals) and access to previously undiscovered zero-day exploits have made it a highly resilient threat.</p>	
Observed	<p>Sectors: Defense, Financial, Government, Intelligence agencies and Telecommunications. Countries: China, India, Indonesia, Malaysia, Singapore, Thailand and Vietnam.</p>	
Tools used	adbupd, AMTsol, DvDupdate.dll, JPIN, psinstrc.ps1, RedPepper, RedSalt, Titanium and Living off the Land.	
Operations performed	2017	Since the 2016 publication, Microsoft has come across an evolution of PLATINUM's file-transfer tool, one that uses the Intel Active Management Technology (AMT) Serial-over-LAN (SOL) channel for communication. This channel works independently of the operating system (OS), rendering any communication over it invisible to firewall and network monitoring applications running on the host device. Until this incident, no malware had been discovered misusing the AMT SOL feature for communication. <https://www.microsoft.com/security/blog/2017/06/07/platinum-continues-to-evolve-find-ways-to-maintain-invisibility>
	Mid 2017	Operation "EasternRoppels" In the middle of 2017, Kaspersky Lab experts discovered a new malicious threat that is believed to be related to the famous PLATINUM APT group, which had been widely regarded as inactive. They named the campaign 'EasternRoppels'. <https://aavar.org/avar2018/index.php/the-easternroppels-operation-platinum-group-is-back/> <https://securelist.com/platinum-is-back/91135/>
	Nov 2019	During recent analysis we discovered Platinum using a new backdoor that we call Titanium (named after a password to one of the self-executable archives). Titanium is the final result of a sequence of dropping, downloading and installing stages.

Country	China	
Motivation	Information theft and espionage	
First seen	2018	
Description	<p>(Citizen Lab)</p> <ul style="list-style-type: none">Between November 2018 and May 2019, senior members of Tibetan groups received malicious links in individually tailored WhatsApp text exchanges with operators posing as NGO workers, journalists, and other fake personas. The links led to code designed to exploit web browser vulnerabilities to install spyware on iOS and Android devices, and in some cases to OAuth phishing pages. This campaign was carried out by what appears to be a single operator that we call POISON CARP.We observed POISON CARP employing a total of eight Android browser exploits and one Android spyware kit, as well as one iOS exploit chain and iOS spyware. None of the exploits that we observed were zero days. POISON CARP overlaps with two recently reported campaigns against the Uyghur community. The iOS exploit and spyware we observed was used in watering hole attacks reported by Google Project Zero, and a website used to serve exploits by POISON CARP was also observed in a campaign called "Evil Eye" reported by Volexity. The Android malware used in the campaign is a fully featured spyware kit that has not been previously documented.POISON CARP appears to have used Android browser exploits from a variety of sources. In one case, POISON CARP used a working exploit publicly released by Exodus Intelligence for a Google Chrome bug that was fixed in source, but whose patch had not yet been distributed to Chrome users. In other cases, POISON CARP used lightly modified versions of Chrome exploit code published on the personal GitHub pages of a member of Qihoo 360's Vulcan Team, a member of Tencent's Xuanwu Lab, and by a Google Project Zero member on the Chrome Bug Tracker. <p>This campaign is the first documented case of one-click mobile exploits used to target Tibetan groups, and reflects an escalation in the sophistication of digital espionage threats targeting the community.</p>	
Observed	Tibetan and Uyghur activists as well as those who are interested in their causes.	
Tools used	ActionSpy, Bourbon, IceCube, MOONSHINE, PoisonCarp, Scotch, Whisky and several exploits in iOS, Android and Google Chrome.	
Operations performed	Jan 2020	Immediately after the publications from Google and Volexity, the Evil Eye threat actor went fairly quiet. They removed their malicious code from compromised websites, command and control (C2) servers were taken down, and various hostnames stopped resolving. This largely remained the case until early January 2020, when Volexity observed a series of new activity across multiple previously compromised Uyghur websites. https://www.volexity.com/blog/2020/04/21/evil-eye-threat-actor-resurfaces-with-ios-exploit-and-updated-implant/

	Early 2020	While tracking Earth Empura, also known as POISON CARP/Evil Eye, we identified an undocumented Android spyware we have named ActionSpy. < https://blog.trendmicro.com/trendlabs-security-intelligence/new-android-spyware-actionspy-revealed-via-phishing-attacks-from-earth-empusa/ >

Poseidon Group

Names	Poseidon Group (Kaspersky)	
Country	Brazil	
Motivation	Information theft and espionage	
First seen	2005	
Description	<p>(Kaspersky) During the latter part of 2015, Kaspersky researchers from GreAT (Global Research and Analysis Team) got hold of the missing pieces of an intricate puzzle that points to the dawn of the first Portuguese-speaking targeted attack group, named "Poseidon." The group's campaigns appear to have been active since at least 2005, while the very first sample found points to 2001. This signals just how long ago the Poseidon threat actor was already working on its offensive framework.</p> <p>The Poseidon Group is a long-running team operating on all domains: land, air, and sea. They are dedicated to running targeted attacks campaigns to aggressively collect information from company networks through the use of spear-phishing packaged with embedded, executable elements inside office documents and extensive lateral movement tools. The information exfiltrated is then leveraged by a company front to blackmail victim companies into contracting the Poseidon Group as a security firm. Even when contracted, the Poseidon Group may continue its infection or initiate another infection at a later time, persisting on the network to continue data collection beyond its contractual obligation. The Poseidon Group has been active, using custom code and evolving their toolkit since at least 2005. Their tools are consistently designed to function on English and Portuguese systems spanning the gamut of Windows OS, and their exfiltration methods include the use of hijacked satellite connections. Poseidon continues to be active at this time.</p>	
Observed	<p>Sectors: Energy, Financial, Government, Media, Manufacturing, Telecommunications and Utilities.</p> <p>Countries: Brazil, France, India, Kazakhstan, Russia, UAE and USA.</p>	
Tools used	IGT supertool.

PowerPool

Names	PowerPool (ESET)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2018
Description	<p>(ESET) On August 27, 2018, a so-called zero-day vulnerability affecting Microsoft Windows was published on GitHub and publicized via a rather acerbic tweet.</p> <p>It seems obvious that this was not part of a coordinated vulnerability disclosure and there was no patch at the time this tweet (since deleted) was published to fix the vulnerability.</p> <p>It affects Microsoft Windows OSes from Windows 7 to Windows 10, and in particular the Advanced Local Procedure Call (ALPC) function, and allows a Local Privilege Escalation (LPE). LPE allows an executable or process to escalate privileges. In that specific case, it allows an executable launched by a restricted user to gain administrative rights.</p> <p>The tweet linked to a GitHub repository that contains Proof-of-Concept code for the exploit. Not only was a compiled version released – the source code was also. Consequently, anyone can modify and recompile the exploit, in order to “improve it”, evade detection, or even incorporate it into their code.</p> <p>As one could have predicted, it took only two days before we first identified the use of this exploit in a malicious campaign from a group we have dubbed PowerPool. This group has a small number of victims and according to both our telemetry and uploads to VirusTotal (we only considered manual uploads from the web interface), the targeted countries include Chile, Germany, India, the Philippines, Poland, Russia, the United Kingdom, the United States and Ukraine.</p>
Observed	Countries: Chile, Germany, India, Philippines, Poland, Russia, UK, Ukraine, USA and others.
Tools used	ALPC Local PrivEsc, FireMaster, PowerDump, PowerSploit, Quarks PwDump and SMBExec.
Information	< https://www.welivesecurity.com/2018/09/05/powerpool-malware-exploits-zero-day-vulnerability/ >

Promethium, StrongPity

Names	Promethium (<i>Microsoft</i>) StrongPity (<i>Kaspersky</i>)	
Country	Turkey	
Motivation	Information theft and espionage	
First seen	2012	
Description	<p>Promethium is an activity group that has been active since at least 2012. The group conducted a campaign in May 2016 and has heavily targeted Turkish victims.</p> <p>Promethium has demonstrated similarity to another activity group called Neodymium due to overlapping victim and campaign characteristics.</p> <p>(<i>Microsoft</i>) Promethium is an activity group that has been active as early as 2012. The group primarily uses Truvasys, a first-stage malware that has been in circulation for several years. Truvasys has been involved in several attack campaigns, where it has masqueraded as one of server common computer utilities, including WinUtils, TrueCrypt, WinRAR, or SanDisk. In each of the campaigns, Truvasys malware evolved with additional features—this shows a close relationship between the activity groups behind the campaigns and the developers of the malware.</p>	
Observed	Countries: Algeria, Belgium, Canada, Colombia, Cote d'Ivoire, Egypt, France, Germany, Iraq, India, Italy, Morocco, Netherlands, Poland, Senegal, South Africa, Syria, Tunisia, Turkey, USA and Vietnam.	
Tools used	StrongPity, StrongPity2, StrongPity2 and Truvasys.	
Operations performed	Mar 2018	Sandvine's PacketLogic Devices Used to Deploy Government Spyware in Turkey and Redirect Egyptian Users to Affiliate Ads? https://citizenlab.ca/2018/03/bad-traffic-sandvines-packetlogic-devices-deploy-government-spyware-turkey-syria/
	Mar 2018	Two months after the Citizen Lab report, Cylance found new Promethium/StrongPity activity, utilizing new infrastructure. The observed domains all appeared to have been registered about two weeks after Citizen Lab's report. The malware has continued to adapt as new information is published. Minimal effort and code changes were all that was required to stay out of the limelight. Cylance observed new domains, new IP addresses, filename changes, and small code obfuscation changes. https://threatvector.cylance.com/en_us/home/whack-a-mole-the-impact-of-threat-intelligence-on-adversaries.html
	Jul 2019	In early July 2019 Alien Labs began identifying new samples resembling StrongPity. The new malware samples have been unreported and generally appear to have been created and deployed to targets following a toolset rebuild in response to the above public reporting during the fourth quarter of 2018. https://www.alienvault.com/blogs/labs-research/newly-identified-strongpity-operations#When:13:00:00Z

Pusikurac

Names	Pusikurac (<i>Morphisec</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2019
Description	<p>(Morphisec) A new, highly sophisticated campaign that delivers the Orcus Remote Access Trojan is hitting victims in ongoing, targeted attacks. Morphisec identified the campaign after receiving notifications from its advanced prevention solution at several deployment sites. (Morphisec's Moving Target Defense technology immediately stopped the threat.) The attack uses multiple advanced evasive techniques to bypass security tools. In a successful attack, the Orcus RAT can steal browser cookies and passwords, launch server stress tests (DDoS attacks), disable the webcam activity light, record microphone input, spoof file extensions, log keystrokes and more.</p> <p>The forensic data captured by Morphisec from the attack showed a high correlation to additional samples in the wild, indicating a single threat actor is behind multiple campaigns, including this one.</p> <p>This threat actor specifically focuses on information stealing and .NET evasion. Based on unique strings in the malware, we have dubbed the actor PUSIKURAC. Before executing the attacks, PUSIKURAC registers domains through FreeDns services. It also utilizes legitimate free text storage services like paste, signs its executables, heavily misuses commercial .NET packers and embeds payloads within video files and images.</p>
Observed	
Tools used	Orcus RAT.

Rancor

Names	Rancor (<i>Palo Alto</i>) Rancor Group (<i>Palo Alto</i>)
Country	China
Motivation	Information theft and espionage
First seen	2017
Description	<p>(<i>Palo Alto</i>) Throughout 2017 and 2018 Unit 42 has been tracking and observing a series of highly targeted attacks focused in South East Asia, building on our research into the KHRAT Trojan. Based on the evidence, these attacks appear to be conducted by the same set of attackers using previously unknown malware families. In addition, these attacks appear to be highly targeted in their distribution of the malware used, as well as the targets chosen. Based on these factors, Unit 42 believes the attackers behind these attacks are conducting their campaigns for espionage purposes.</p> <p>We believe this group is previously unidentified and therefore have we have dubbed it "Rancor". The Rancor group's attacks use two primary malware families which we describe in depth later in this blog and are naming DDKONG and PLAINTEE. DDKONG is used throughout the campaign and PLAINTEE appears to be new addition to these attackers' toolkit.</p> <p>Kaspersky found connections between this group and DragonOK.</p>
Observed	Sectors, Government and political entities. Countries: Southeast Asia (at least Cambodia, Singapore and Vietnam).
Tools used	8.t Dropper, certutil, Cobalt Strike, DDKONG, Derusbi, Dudell, ExDudell, KHRAT and PLAINTEE.

RATicate

Names	RATicate (<i>Sophos</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2019
Description	<p>(<i>Sophos</i>) In a series of malspam campaigns dating back to November of 2019, an unidentified group sent out waves of installers that drop remote administration tool (RAT) and information stealing malware on victims' computers.</p> <p>We've identified five separate campaigns between November, 2019 and January, 2020 in which the payloads used similar packing code and pointed to the same command and control (C&C) infrastructure. The campaigns targeted industrial companies in Europe, the Middle East, and the Republic of Korea. This leads us to believe that they are all the work of the same actors—a group we've dubbed RATicate.</p> <p>A new campaign we believe connected to the same actors leverages concern about the global COVID-19 pandemic to convince victims to open the payloads. This is a shift in tactics, but we suspect that this group constantly changes the way they deploy malware—and that the group has conducted campaigns prior to this past November.</p>
Observed	Sectors: Industrial, Manufacturing, Media and Telecommunications. Countries: Romania, Japan, Kuwait, South Korea, Switzerland, UK, Europe and Middle East.
Tools used	Agent Tesla, BetaBot, BlackRAT, Formbook, GuLoader, LokiBot, NetWire RC, njRAT, NSIS and RemcosRAT.

RedAlpha

Names	RedAlpha (<i>Recorded Future</i>)	
Country	China	
Sponsor	State-sponsored, possibly PLA and/or Nanjing Qinglan Information Technology Co. Ltd	
Motivation	Information theft and espionage	
First seen	2015	
Description	<p>The original research from Citizen Lab did not give this group a name.</p> <p>(Recorded Future) Recorded Future's Insikt Group has identified two new cyberespionage campaigns targeting the Tibetan community over the past two years. The campaigns, which we are collectively naming RedAlpha, combine light reconnaissance, selective targeting, and diverse malicious tooling. We discovered this activity as the result of pivoting off of a new malware sample observed targeting the Tibetan community based in India.</p> <p>Insikt Group's analysis of infrastructure overlap among the new campaigns reveals wider targeting of the Chinese "Five Poisons," in addition to South and Southeast Asian governments. Based on the campaign's targeting of "Five Poisons"-related organizations, overlapping infrastructure, and links to malware used by other Chinese APTs uncovered during our research, we assess with medium confidence that the RedAlpha campaigns were conducted by a Chinese APT.</p> <p>Infrastructure overlaps have been found with APT 17, Deputy Dog, Elderwood, Sneaky Panda, Icefog, Dagger Panda and NetTraveler, APT 21, Hammer Panda.</p>	
Observed	<p>Sectors: Government, the Tibetan and Uyghur communities and Falun Gong supporters.</p> <p>Countries: Hong Kong, India, Myanmar, Pakistan, Sri Lanka, Thailand, South and Southeast Asia.</p>	
Tools used	FormerFirstRAT, Gh0st RAT, NetHelp Infostealer, njRAT, RedAlpha and a vulnerability in MS Office.

RevengeHotels

Names	RevengeHotels (Kaspersky)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2015
Description	<p>(Kaspersky) RevengeHotels is a campaign that has been active since at least 2015, revealing different groups using traditional RAT malware to infect businesses in the hospitality sector. While there is a marked interest in Brazilian victims, our telemetry shows that their reach has extended to other countries in Latin America and beyond.</p> <p>The use of spear-phishing emails, malicious documents and RAT malware is yielding significant results for at least two groups we have identified in this campaign. Other threat actors may also be part of this wave of attacks, though there is no confirmation at the current time.</p>
Observed	Sectors: Hospitality. Countries: Argentina, Bolivia, Brazil, Chile, Costa Rica, France, Italy, Mexico, Portugal, Spain, Thailand and Turkey.
Tools used	888 RAT, NanoCore RAT, njRAT and RevengeRAT.
Information	< https://securelist.com/revengehotels/95229/ >

Roaming Tiger

Names	Roaming Tiger (<i>ESET</i>)
Country	China
Motivation	Information theft and espionage
First seen	2014
Description	(Palo Alto) In late 2014, ESET presented an attack campaign that had been observed over a period of time targeting Russia and other Russian speaking nations, dubbed "Roaming Tiger". The attack was found to heavily rely on RTF exploits and at the time, thought to make use of the PlugX malware family.
Observed	Countries: Belarus, Kazakhstan, Kyrgyzstan, Russia, Tajikistan, Ukraine and Uzbekistan.
Tools used	BBSRAT, Gh0st RAT and PlugX.
Operations performed	Aug 2015 < https://unit42.paloaltonetworks.com/bbsrat-attacks-targeting-russian-organizations-linked-to-roaming-tiger/ >
Information	< http://2014.zeronights.org/assets/files/slides/roaming_tiger_zeronights_2014.pdf >

Rocket Kitten, Newscaster, NewsBeef

Names	Rocket Kitten (<i>CrowdStrike</i>) Newscaster (<i>Symantec</i>) NewsBeef (<i>Kaspersky</i>) Group 83 (<i>Talos</i>) Parastoo (<i>Flashpoint</i>) Phosphorus (<i>Microsoft</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(Kaspersky) Newsbeef/Newscaster will find a way to compromise a web site, usually the vulnerability appears to be CMS related, in an outdated WordPress plugin, Joomla version, or Drupal version. Attackers usually perform one of two things, Newsbeef has been performing the first of the two:</p> <ul style="list-style-type: none">- inject a src or iframe link into web pages or css sheets- inject the content of an entire BeEF web page into one of the internally linked javascript helpers <p>The injected link will redirect visitors' browsers to a BeEF server. Usually, the attackers deliver some of the tracking and system/browser identification and evercookie capabilities. Sometimes, it appears that they deliver the metasploit integration to exploit and deliver backdoors (we haven't identified that exploitation activity in our ksn data related to this group just yet). Sometimes, it is used to pop up spoofed login input fields to steal social networking site credentials. We also haven't detected that in ksn, but some partners have privately reported it about various incidents. But we have identified that attackers will redirect specific targets to laced Adobe Flash and other installers from websites that they operate.</p> <p>So, the watering hole activity isn't always and usually isn't delivering backdoors. Most of the time, the watering hole injections are used to identify and track visitors or steal their browser history. Then, they deliver the backdoors to the right targets.</p> <p>There is some infrastructure overlap with Magic Hound, APT 35, Cobalt Gypsy, Charming Kitten.</p>	
Observed	Sectors: Construction, Defense, Education, Embassies, Entertainment, Government, Manufacturing and Media. Countries: Algeria, Brazil, China, Germany, India, Israel, Japan, Kazakhstan, Romania, Russia, Turkey, UK, Ukraine, USA.	
Tools used	BeEF, FireMalv and Ghole.	
Operations performed	2011	Operation "Newscaster" The research firm iSight dubbed the operation Newscaster and said hackers used social-media sites like Twitter, Facebook and LinkedIn to draw their targets and then lure them to check out a bogus news site, NewsOnAir.org, filled with foreign policy and defense articles, The Post reported.

		The overall aim is that the social-media platform would give the hackers connections with those at the top of public policy — and position them to tap into that information network. https://www.washingtontimes.com/news/2014/may/29/iranian-hackers-sucker-punch-us-defense-heads-crea/
	Feb 2015	Operation “Woolen-GoldFish” https://www.trendmicro.com/vinfo/us/security/news/cyber-attacks/operation-woolen-goldfish-when-kittens-go-phishing
	Feb 2016	In late February 2016, a University website in Iran stood out for thoroughly vetting its current and potential students and staff. The University’s web site served repackaged content from the Browser Exploitation Framework (BeEF) with embedded JavaScript content. https://securelist.com/freezer-paper-around-free-meat/74503/
	2017	Fake news website BritishNews to infect visitors On the same note, we identified a fake-news agency “established” by the attackers, called “The British news agency” or “Britishnews” (inspired by BBC). Its website domain is britishnews.com[.]co and two other domains, broadcastbritishnews[.]277ommmand britishnews[.]org redirected to it.
	2017	Blackmailing BBC reporter with ‘naked photo’ threats Iranian agents blackmailed a BBC Persian journalist by threatening to publish revealing photos of her as part of a wider campaign against the British media outlet, staff at the broadcaster told Arab News. New details emerged on Saturday about alleged harassment of BBC Persian reporters’ family members and loved ones at the hands of the Iranian security services. http://www.arabnews.com/node/1195681/media

RTM

Names	RTM (ESET)
Country	Russia
Motivation	Financial crime
First seen	2015
Description	<p>(ESET) There are several groups actively and profitably targeting businesses in Russia. A trend that we have seen unfold before our eyes lately is these cybercriminals' use of simple backdoors to gain a foothold in their targets' networks. Once they have this access, a lot of the work is done manually, slowly getting to understand the network layout and deploying custom tools the criminals can use to steal funds from these entities. Some of the groups that best exemplify these trends are Butrap, Ratopak Spider, Cobalt Group and Corkow, Metel.</p> <p>The group discussed in this white paper is part of this new trend. We call this new group RTM; it uses custom malware, written in Delphi, that we cover in detail in later sections. The first trace of this tool in our telemetry data dates back to late 2015. The group also makes use of several different modules that they deploy where appropriate to their targets. They are interested in users of remote banking systems (RBS), mainly in Russia and neighboring countries.</p> <p>That this group is mostly targeting businesses is apparent from the processes they are looking for on a compromised system. They look for software that is usually only installed on accountants' computers, such as remote banking software or tools to help with accounts pay.</p>
Observed	Countries: Czech, Germany, Kazakhstan, Russia and Ukraine.

Safe

Names	Safe (<i>Trend Micro</i>)
Country	China
Motivation	Information theft and espionage
First seen	2013
Description	<p>(<i>Trend Micro</i>) Whether considered advanced persistent threats (APTs) or malware-based espionage attacks, successful and long-term compromises of high-value organizations and enterprises worldwide by a consistent set of campaigns cannot be ignored. Because “noisier” campaigns are becoming increasingly well-known within the security community, new and smaller campaigns are beginning to emerge.</p> <p>This research paper documents the operations of a campaign we refer to as “Safe,” based on the names of the malicious files used. It is an emerging and active targeted threat.</p> <p>While we have yet to determine the campaign’s total number of victims, it appears that nearly 12,000 unique IP addresses spread over more than 100 countries were connected to two sets of command-and-control (C&C) infrastructures related to Safe. We also discovered that the average number of actual victims remained at 71 per day, with few if any changes from day to day. This indicates that the actual number of victims is far less than the number of unique IP addresses. Due to large concentrations of IP addresses within specific network blocks, it is likely that the number of victims is even smaller and that they have dynamically assigned IP addresses, which have been compromised for some time now.</p>
Observed	Sectors: Education, Government, Media, NGOs and Technology. Countries: Algeria, Australia, Brazil, Bulgaria, Canada, China, Egypt, Hungary, India, Malaysia, Mongolia, Pakistan, Philippines, Romania, Russia, Saudi Arabia, Serbia, South Korea, South Sudan, Syria, UAE and USA.

Samurai Panda

Names	Samurai Panda (<i>CrowdStrike</i>)
Country	China
Sponsor	State-sponsored, PLA Navy
Motivation	Information theft and espionage
First seen	2009
Description	<p>(CrowdStrike) Samurai Panda is interesting in that their target selection tends to focus on Asia Pacific victims in Japan, the Republic of Korea, and other democratic Asian victims. Beginning in 2009, we've observed this actor conduct more than 40 unique campaigns that we've identified in the malware configurations' campaign codes. These codes are often leveraged in the malware used by coordinated targeted attackers to differentiate victims that were successfully compromised from different target sets.</p> <p>The implant delivered by Samurai Panda uses a typical installation process whereby they:</p> <ol style="list-style-type: none">1. Leverage a spear-phish with an exploit to get control of the execution flow of the targeted application. This file "drops" an XOR-encoded payload that unpacks itself and a configuration file.2. Next, the implant, which can perform in several different modes, typically will install itself as a service and then begin beaconing out to an adversary-controlled host.3. If that command-and-control host is online, the malicious service will download and instantiate a backdoor that provides remote access to the attacker, who will see the infected host's identification information as well as the campaign code.
Observed	Sectors: Defense and Government. Countries: Hong Kong, Japan, South Korea, UK and USA.
Tools used	FormerFirstRAT, IsSpace, PlugX, Poldat and Sykipot.
Information	< https://www.crowdstrike.com/blog/whois-samurai-panda/ >

Scarlet Mimic

Names	Scarlet Mimic (<i>Palo Alto</i>)
Country	China
Motivation	Information theft and espionage
First seen	2015
Description	<p>Scarlet Mimic is a threat group that has targeted minority rights activists. This group has not been directly linked to a government source, but the group's motivations appear to overlap with those of the Chinese government. While there is some overlap between IP addresses used by Scarlet Mimic and Putter Panda, APT 2, it has not been concluded that the groups are the same.</p> <p>(<i>Palo Alto</i>) The attacks began over four years ago and their targeting pattern suggests that this adversary's primary mission is to gather information about minority rights activists. We do not have evidence directly linking these attacks to a government source, but the information derived from these activities supports an assessment that a group or groups with motivations similar to the stated position of the Chinese government in relation to these targets is involved.</p> <p>The attacks we attribute to Scarlet Mimic have primarily targeted Uyghur and Tibetan activists as well as those who are interested in their causes. Both the Tibetan community and the Uyghurs, a Turkic Muslim minority residing primarily in northwest China, have been targets of multiple sophisticated attacks in the past decade. Both also have history of strained relationships with the government of the People's Republic of China (PRC), though we do not have evidence that links Scarlet Mimic attacks to the PRC.</p> <p>Scarlet Mimic attacks have also been identified against government organizations in Russia and India, who are responsible for tracking activist and terrorist activities. While we do not know the precise target of each of the Scarlet Mimic attacks, many of them align to the patterns described above.</p>
Observed	Tibetan and Uyghur activists as well as those who are interested in their causes.

Sea Turtle

Names	Sea Turtle (<i>Talos</i>)	
Country	Turkey	
Motivation	Information theft and espionage	
First seen	2017	
Description	<p>(Talos) Cisco Talos has discovered a new cyber threat campaign that we are calling “Sea Turtle,” which is targeting public and private entities, including national security organizations, located primarily in the Middle East and North Africa. The ongoing operation likely began as early as January 2017 and has continued through the first quarter of 2019. Our investigation revealed that at least 40 different organizations across 13 different countries were compromised during this campaign. We assess with high confidence that this activity is being carried out by an advanced, state-sponsored actor that seeks to obtain persistent access to sensitive networks and systems.</p> <p>The actors behind this campaign have focused on using DNS hijacking as a mechanism for achieving their ultimate objectives. DNS hijacking occurs when the actor can illicitly modify DNS name records to point users to actor-controlled servers. The Department of Homeland Security (DHS) issued an alert about this activity on Jan. 24 2019, warning that an attacker could redirect user traffic and obtain valid encryption certificates for an organization’s domain names.</p>	
Observed	<p>Sectors: Aerospace, Defense, Energy, Government, Intelligence agencies, NGOs and Think Tanks.</p> <p>Countries: Albania, Armenia, Cyprus, Egypt, Greece, Iraq, Jordan, Lebanon, Libya, Sudan, Sweden, Switzerland, Syria, Turkey, UAE and USA.</p>	
Tools used	DNS hijacking and Drupaleddon.	
Operations performed	Jan 2018	Talos now has moderate confidence that the threat actors behind Sea Turtle have been using another DNS hijacking technique. This new technique has been used very sparingly, and thus far have only identified two entities that were targeted in 2018, though we believe there are likely more.
	Apr 2019	The Institute of Computer Science of the Foundation for Research and Technology – Hellas (ICS-Forth), the ccTLD for Greece, acknowledged on its public website that its network had been compromised on April 19, 2019. Based on Cisco telemetry, we determined that the actors behind the Sea Turtle campaign had access to the ICS-Forth network. <https://blog.talosintelligence.com/2019/07/sea-turtle-keeps-on-swimming.html>
Information	<https://blog.talosintelligence.com/2019/04/seaturtle.html>	

Shadow Network

Names	Shadow Network (<i>Information Warfare Monitor</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(Information Warfare Monitor) Shadows in the Cloud documents a complex ecosystem of cyber espionage that systematically compromised government, business, academic, and other computer network systems in India, the Offices of the Dalai Lama, the United Nations, and several other countries. The report also contains an analysis of data which were stolen from politically sensitive targets and recovered during the course of the investigation. These include documents from the Offices of the Dalai Lama and agencies of the Indian national security establishment. Data containing sensitive information on citizens of numerous third-party countries, as well as personal, financial, and business information, were also exfiltrated and recovered during the course of the investigation. The report analyzes the malware ecosystem employed by the Shadows' attackers, which leveraged multiple redundant cloud computing systems, social networking platforms, and free web hosting services in order to maintain persistent control while operating core servers located in the People's Republic of China (PRC). Although the identity and motivation of the attackers remain unknown, the report is able to determine the location (Chengdu, PRC) as well as some of the associations of the attackers through circumstantial evidence. The investigation is the product of an eight month, collaborative activity between the Information Warfare Monitor (Citizen Lab and SecDev) and the Shadowserver Foundation. The investigation employed a fusion methodology, combining technical interrogation techniques, data analysis, and field research, to track and uncover the Shadow cyber espionage network.</p> <p>Also see GhostNet, Snooping Dragon.</p>	
Observed	<p>Sectors: Education, Government and others. Countries: Afghanistan, Australia, Azerbaijan, Canada, China, France, Germany, Greece, Hong Kong, India, Israel, Italy, Japan, Lithuania, Malaysia, Mexico, Nepal, Netherlands, New Zealand, Pakistan, Papua New Guinea, Philippines, Qatar, Romania, Russia, South Korea, Sweden, Taiwan, Thailand, Tibet, UAE, UK, USA and Vietnam.</p>	
Tools used	ShadowNet.	
Counter operations	2010	Taken down by the Shadowserver Foundation.
Information	<https://citizenlab.ca/wp-content/uploads/2017/05/shadows-in-the-cloud.pdf>	

ShaggyPanther

Names	ShaggyPanther (<i>Kaspersky</i>)
Country	China
Motivation	Information theft and espionage
First seen	2018
Description	(Kaspersky) We first discussed ShaggyPanther, a previously unseen malware and intrusion set targeting Taiwan and Malaysia, in a private report in January 2018. Related activities date back to more than a decade ago, with similar code maintaining compilation timestamps from 2004. Since then, ShaggyPanther activity has been detected in several more locations: most recently in Indonesia in July, and – somewhat surprisingly – in Syria in March. The newer 2018 and 2019 backdoor code maintains a new layer of obfuscation and no longer maintains clear-text C2 strings. Since our original release, we have identified an initial server-side infection vector from this actor, using SinoChopper/ChinaChopper, a commonly used web shell shared by multiple Chinese-speaking actors. SinoChopper not only performs host identification and backdoor delivery but also email archive theft and additional activity. Although not all incidents can be traced back to server-side exploitation, we did detect a couple of cases and obtained information about their staged install process. In 2019, we observed ShaggyPanther targeting Windows servers.
Observed	Sectors: Government. Countries: Indonesia, Malaysia, Syria and Taiwan.
Tools used	China Chopper.
Information	< https://securelist.com/ksb-2019-review-of-the-year/95394/ >

SideWinder, Rattlesnake

Names	SideWinder (<i>Kaspersky</i>) Rattlesnake (<i>Tencent</i>) T-APT-04 (<i>Tencent</i>) APT-C-17 (<i>Qihoo 360</i>)
Country	India
Motivation	Information theft and espionage
First seen	2012
Description	(<i>Kaspersky</i>) An actor mainly targeting Pakistan military targets, active since at least 2012. We have low confidence that this malware might be authored by an Indian company. To spread the malware, they use unique implementations to leverage the exploits of known vulnerabilities (such as CVE-2017-11882) and later deploy a Powershell payload in the final stages.
Observed	Sectors: Defense and Government. Countries: China, Pakistan and South Asia.
Tools used	callCam.
Operations performed	Mar 2019 First Active Attack Exploiting CVE-2019-2215 Found on Google Play, Linked to SideWinder APT Group < https://blog.trendmicro.com/trendlabs-security-intelligence/first-active-attack-exploiting-cve-2019-2215-found-on-google-play-linked-to-sidewinder-apt-group/ >

Siesta

Names	Siesta (<i>Trend Micro</i>)
Country	China
Motivation	Information theft and espionage
First seen	2014
Description	<p>(Trend Micro) In the past few weeks, we have received several reports of targeted attacks that exploited various application vulnerabilities to infiltrate various organizations. Similar to the Safe Campaign, the campaigns we noted went seemingly unnoticed and under the radar.</p> <p>(FireEye) FireEye recently looked deeper into the activity discussed in TrendMicro's blog and dubbed the "Siesta" campaign. The tools, modus operandi, and infrastructure used in the campaign present two possibilities: either the Chinese cyber-espionage unit Comment Crew, APT 1 is perpetrating this activity, or another group is using the same tactics and tools as the legacy APT1.</p> <p>The Siesta campaign reinforces the fact that analysts and network defenders should remain on the lookout for known, public indicators and for shared attributes that allow security experts to detect multiple actors with one signature.</p>
Observed	Sectors: Defense, Energy, Financial, Government, Healthcare, Media, Telecommunications and Transportation.
Tools used	Poison Ivy.
Information	< https://blog.trendmicro.com/trendlabs-security-intelligence/the-siesta-campaign-a-new-targeted-attack-awakens/ > < https://www.fireeye.com/blog/threat-research/2014/03/a-detailed-examination-of-the-siesta-campaign.html >

Silence, Contract Crew

Names	Silence (<i>Kaspersky</i>) Contract Crew (<i>iDefense</i>) Whisper Spider (<i>CrowdStrike</i>) TEMP.TruthTeller (<i>FireEye</i>) ATK 86 (<i>Thales</i>) TAG-CR8
Country	[Unknown]
Motivation	Financial crime
First seen	2016
Description	<p>(Group-IB) Group-IB has exposed the attacks committed by Silence cybercriminal group. While the gang had previously targeted Russian banks, Group-IB experts also have discovered evidence of the group's activity in more than 25 countries worldwide. Group-IB has published its first detailed report on tactics and tools employed by Silence. Group-IB security analysts' hypothesis is that at least one of the gang members appears to be a former or current employee of a cyber security company. The confirmed damage from Silence activity is estimated at 800 000 USD.</p> <p>Silence is a group of Russian-speaking hackers, based on their commands language, the location of infrastructure they used, and the geography of their targets (Russia, Ukraine, Belarus, Azerbaijan, Poland, and Kazakhstan). Although phishing emails were also sent to bank employees in Central and Western Europe, Africa, and Asia). Furthermore, Silence used Russian words typed on an English keyboard layout for the commands of the employed backdoor. The hackers also used Russian-language web hosting services.</p> <p>Group-IB found several relationships between Silence and TA505, Graceful Spider, Gold Evergreen.</p>
Observed	Sectors: Financial, Government, Manufacturing and Pharmaceutical. Sima

Names	Sima (<i>Amnesty International</i>)
Country	Iran
Motivation	Information theft and espionage
First seen	2016
Description	<p>In February 2016, Iran-focused individuals received messages purporting to be from Human RightsWatch's (HRW) Emergencies Director, requesting that they read an article about Iran pressuring Afghan refugees to fight in Syria. While referencing a real report published by HRW, the links provided for the Director's biography and article directed the recipient to malware hosted elsewhere. These spear-phishing attempts represent an evolution of Iranian actors based on their social engineering tactics and narrow targeting. Although the messages still had minor grammatical and stylistic errors that would be obvious to a native speaker, the actors demonstrated stronger English-language proficiency than past intrusion sets and a deeper investment in background research prior to the attempt. The actors appropriated a real identity that would be expected to professionally interact with the subject, then offered validation through links to their biography and social media, the former of which itself was malware as well. The bait documents contained a real article relevant to their interests and topic referenced, and the message attempted to address how it aligned with their professional research or field of employment. The referenced documents sent were malware binaries posing as legitimate files using the common right-to-left filenames tactic in order to conceal the actual file extension. All of these techniques, while common pretexting mechanisms, are a refinement compared to a tendency amongst other groups to simply continually send different forms of generic malware or phishing, in the hopes that one would eventually be successful.</p>
Observed	This group targets Iranians in diaspora.
Tools used	Luminosity RAT and Sima.
Information	< https://www.blackhat.com/docs/us-16/materials/us-16-Guarnieri-Iran-And-The-Soft-War-For-Internet-Dominance-wp.pdf >

Slingshot

Names	Slingshot (Kaspersky)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2012
Description	<p>(Kaspersky) While analyzing an incident which involved a suspected keylogger, we identified a malicious library able to interact with a virtual file system, which is usually the sign of an advanced APT actor. This turned out to be a malicious loader internally named 'Slingshot', part of a new, and highly sophisticated attack platform that rivals Project Sauron and Regin in complexity.</p> <p>While for most victims the infection vector for Slingshot remains unknown, we were able to find several cases where the attackers got access to MikroTik routers and placed a component downloaded by Winbox Loader, a management suite for MikroTik routers. In turn, this infected the administrator of the router.</p> <p>We believe this cluster of activity started in at least 2012 and was still active at the time of this analysis (February 2018).</p>
Observed	Countries: Afghanistan, Congo, Iraq, Jordan, Kenya, Libya, Somalia, Sudan, Tanzania, Turkey and Yemen.
Tools used	Cahnadr, GollumApp, Slingshot and WinBox (a utility used for MikroTik router configuration).
Information	< https://securelist.com/apt-slingshot/84312/ >

Snake Wine

Names	Snake Wine (<i>Cylance</i>)
Country	China
Motivation	Information theft and espionage
First seen	2016
Description	<p>(Cylance) While investigating some of the smaller name servers that Sofacy, APT 28, Fancy Bear, Sednit routinely use to host their infrastructure, Cylance discovered another prolonged campaign that appeared to exclusively target Japanese companies and individuals that began around August 2016. The later registration style was eerily close to previously registered APT28 domains, however, the malware used in the attacks did not seem to line up at all. During the course of our investigation, JPCERT published this analysis of one of the group's backdoors. Cylance tracks this threat group internally as 'Snake Wine'.</p> <p>The Snake Wine group has proven to be highly adaptable and has continued to adopt new tactics in order to establish footholds inside victim environments. The exclusive interest in Japanese government, education, and commerce will likely continue into the future as the group is just starting to build and utilize their existing current attack infrastructure.</p>
Observed	Sectors: Commerce, Education and Government. Countries: Japan.
Tools used	ChChes and Tofu Backdoor.
Information	< https://threatvector.cylance.com/en_us/home/the-deception-project-a-new-japanese-centric-threat.html > < https://www.jpcert.or.jp/magazine/acreport-ChChes.html >

Motivation	Information theft and espionage
First seen	2011
Description	<p>(Gdata) The revelation about the existence of yet another potentially nation-state driven spyware occurred in March 2014 when Le Monde first published information about top secret slides originating from 2011 and part of their content. But the slides Le Monde published revealed only a small part of the picture – several slides were cut out, some information was redacted. Germany's Der Spiegel re-published the slide set with far less deletions recently, in January 2015, and therefore gave a deeper insight about what CSEC actually says they have tracked down.</p> <p>The newly published documents reveal: the so called operation SNOWGLOBE, was discovered in 2009 (slide 9) and consists of three different “implants”, two were dubbed snowballs and one “more sophisticated implant, discovered in mid-2010” is tagged as snowman (slide 7). According to slide 22, “CSEC assesses, with moderate certainty, SNOWGLOBE to be a state-sponsored CNO [Cyber Network Operation] effort, put forth by a French intelligence agency.” The information given dates back to 2011 and nothing else has been published since. Now that specific Babar samples have been identified and analyzed, there might be new information, also with regards to similarities or differences between the two Remote Administration Tools (RATs) EvilBunny and Babar.</p>
Observed	Sectors: Defense, Government, Media and private sectors. Countries: Algeria, Austria, China, Congo, Cote d'Ivoire, Germany, Greece, Iran, Iraq, Israel, Malaysia, Morocco, Netherlands, New Zealand, Norway, Russia, Spain, Syria, Turkey, UK, Ukraine and USA.
Tools used	Babar, Casper, Dino, EvilBunny, Tafacalou, Nbot and Chocopop.

Sofacy, APT 28, Fancy Bear, Sednit

Names	Sofacy (<i>Kaspersky</i>) APT 28 (<i>Mandiant</i>) Fancy Bear (<i>CrowdStrike</i>) Sednit (<i>ESET</i>) Group 74 (<i>Talos</i>) TG-4127 (<i>SecureWorks</i>) Pawn Storm (<i>Trend Micro</i>) Tsar Team (<i>iSight</i>) Strontium (<i>Microsoft</i>) Swallowtail (<i>Symantec</i>) SIG40 (<i>NSA</i>) Snakemackerel (<i>iDefense</i>) Iron Twilight (<i>SecureWorks</i>) ATK 5 (<i>Thales</i>) T-APT-12 (<i>Tencent</i>) TAG-0700 Grizzly Steppe (<i>US Government</i>) together with APT 29, Cozy Bear, The Dukes
Country	Russia
Sponsor	State-sponsored, two GRU units known as Unit 26165 and Unit 74455
Motivation	Information theft and espionage
First seen	2004
Description	<p>APT 28 is a threat group that has been attributed to Russia's Main Intelligence Directorate of the Russian General Staff by a July 2018 U.S. Department of Justice indictment. This group reportedly compromised the Hillary Clinton campaign, the Democratic National Committee, and the Democratic Congressional Campaign Committee in 2016 in an attempt to interfere with the U.S. presidential election. APT 28 has been active since at least January 2007.</p> <p>(FireEye) APT28 likely seeks to collect intelligence about Georgia's security and political dynamics by targeting officials working for the Ministry of Internal Affairs and the Ministry of Defense.</p> <p>APT28 has demonstrated interest in Eastern European governments and security organizations. These victims would provide the Russian government with an ability to predict policymaker intentions and gauge its ability to influence public opinion.</p> <p>APT28 appeared to target individuals affiliated with European security organizations and global multilateral institutions. The Russian government has long cited European security organizations like NATO and the OSCE as existential threats, particularly during periods of increased tension in Europe.</p> <p>Sofacy may be related to Hades, but it could be a false flag as well.</p>
Observed	<p>Sectors: Automotive, Aviation, Chemical, Construction, Defense, Education, Embassies, Engineering, Financial, Government, Healthcare, Industrial, Intelligence organizations, IT, Media, NGOs, Oil and gas and Think Tanks.</p> <p>Countries: Afghanistan, Armenia, Australia, Belarus, Belgium, Brazil, Bulgaria, Canada, Chile, China, Croatia, Cyprus, France, Georgia, Germany, Hungary, India, Iran, Iraq, Japan, Jordan, Kazakhstan, Latvia, Malaysia, Mexico, Mongolia, Montenegro, Netherlands, Norway, Pakistan, Poland, Romania, Slovakia, South</p>

	Africa, South Korea, Spain, Sweden, Switzerland, Tajikistan, Thailand, Turkey, Uganda, UAE, UK, Ukraine, USA, Uzbekistan, APEC, OSCE and NATO.
Tools used	Cannon, certutil, Computrace, CORESHELL, DealersChoice, Downdelph, Foozer, HIDEDRV, JHUHUGIT, Koadic, Komplex, LoJax, Mimikatz, Nimcy, OLDBAIT, PocoDown, ProcDump, PythocyDbg, Responder, Sedkit, Sedreco, USBStealer, VPNFilter, Winexe, WinIDS, X-Agent, X-Tunnel, Zebrocy and Living off the Land.
Operations performed	<p>2011-2012 Back in 2011-2012, the group used a relatively tiny implant (known as "Sofacy" or SURFACE) as its first stage malware. The implant shared certain similarities with the old Miniduke implants. This led us to believe the two groups were connected, at least to begin with, although it appears they parted ways in 2014, with the original Miniduke group switching to the CosmicDuke implant.</p> <p>2013 At some point during 2013, the Sofacy group expanded its arsenal and added more backdoors and tools, including CORESHELL, SPLM (aka Xagent, aka CHOPSTICK), JHUHUGIT (which is built with code from the Carberp sources), AZZY (aka ADVSTORESHELL, NETUI, EVILTOSS, and spans across four to five generations) and a few others. We've seen quite a few versions of these implants and they were relatively widespread for a time.</p> <p>Oct 2014 Operation "Pawn Storm" Target: Several foreign affairs ministries from around the globe. Method: Spear-phishing e-mails with links leading to an Adobe Flash exploit. https://blog.trendmicro.com/trendlabs-security-intelligence/new-adobe-flash-zero-day-used-in-pawn-storm-campaign/</p> <p>Dec 2014 Six-month-long cyberattack on the German parliament http://www.lse.co.uk/AllNews.asp?code=kwdwehme&headline=Russian_Hackers_Suspected_In_Cyberattack_On_German_Parliament</p> <p>Feb 2015 U.S. military wives' death threats Five military wives received death threats from a hacker group calling itself "Cyber Caliphate Army (CCA), United Cyber Caliphate (UCC)", claiming to be an Islamic State affiliate, on February 10, 2015. This was later discovered to have been a false flag attack by Fancy Bear, when the victims' email addresses were found to have been in the Fancy Bear phishing target list. https://www.apnews.com/4d174e45ef5843a0ba82e804f080988f</p> <p>Apr 2015 Compromise of TV5Monde in France "A group calling itself the Cyber Caliphate Army (CCA), United Cyber Caliphate (UCC), linked to so-called Islamic State, first claimed responsibility. Jun 2016	Breach of Democratic National Committee	

	<p>Fancy Bear carried out spear-phishing attacks on email addresses associated with the Democratic National Committee in the first quarter of 2016. On March 10, phishing emails that were mainly directed at old email addresses of 2008 Democratic campaign staffers began to arrive. One of these accounts may have yielded up to date contact lists. The next day, phishing attacks expanded to the non-public email addresses of high level Democratic Party officials. Hillaryclinton.com addresses were attacked, but required two factor authentication for access. The attack redirected towards Gmail accounts on March 19th. Podesta's Gmail account was breached the same day, with 50,000 emails stolen.</p> <p>Another sophisticated hacking group attributed to the Russian Federation, nicknamed APT 29, Cozy Bear, The Dukes appears to be a different agency, one more interested in traditional long-term espionage.</p> <p><https://www.crowdstrike.com/blog/bears-midst-intrusion-democratic-national-committee/></p> <p><https://www.secureworks.com/research/threat-group-4127-targets-google-accounts></p>
Jun 2016	<p>"Exercise Noble Partner 2016" spear-phishing e-mail</p> <p>Method: Spear-phishing e-mail</p> <p>Target: USA government</p> <p><https://unit42.paloaltonetworks.com/unit42-new-sofacy-attacks-against-us-government-agency/></p>
Aug 2016	<p>Spear-phishing attack members of the Bundestag and multiple political parties such as Linken-faction leader Sahra Wagenknecht, Junge Union and the CDU of Saarland. Authorities feared that sensitive information could be gathered by hackers to later manipulate the public ahead of elections such as Germany's next federal election which was due in September 2017.</p> <p><http://www.dw.com/en/hackers-lurking-parliamentarians-told/a-19564630></p>
Aug 2016	<p>World Anti-Doping Agency</p> <p>Method: Phishing emails sent to users of its database claiming to be official WADA communications requesting their login details.</p> <p><http://www.ibtimes.co.uk/russian-hackers-fancy-bear-likely-breached-olympic-drug-testing-agency-dnc-experts-say-1577508></p>
Sep 2016	<p>Operation "Komplex"</p> <p><https://unit42.paloaltonetworks.com/unit42-sofacys-komplex-os-x-trojan/></p>
Oct 2016	<p>Operation "DealersChoice"</p> <p><researchcenter.paloaltonetworks.com/2016/10/unit42-dealerschoice-sofacys-flash-player-exploit-platform/></p> <p><https://unit42.paloaltonetworks.com/unit42-let-ride-sofacy-groups-dealerschoice-attacks-continue/></p> <p>The global reach that coincided with this focus on NATO and the Ukraine couldn't be overstated. Our KSN data showed spear-phishing targets geo-located across the globe into 2017.</p> <p>AM, AZ, FR, DE, IQ, IT, KG, MA, CH, UA, US, VN</p>

		DealersChoice emails, like the one above, that we were able to recover from third party sources provided additional targeting insight, and confirmed some of the targeting within our KSN data: TR, PL, BA, AZ, KR, LV, GE, LV, AU, SE, BE
Early 2017		GAMEFISH backdoor Target: Europe. Method: They took advantage of the Syrian military conflict for thematic content and file naming “Trump’s_Attack_on_Syria_English.docx”. Again, this deployment was likely a part of their focus on NATO targets.
Early 2017		LoJax: First UEFI rootkit found in the wild https://www.welivesecurity.com/2018/09/27/lojax-first-uefi-rootkit-found-wild-courtesy-sednit-group/
Feb 2017		Attack on Dutch ministries In February 2017, the General Intelligence and Security Service (AIVD) of the Netherlands revealed that Fancy Bear and Cozy Bear had made several attempts to hack into Dutch ministries, including the Ministry of General Affairs, over the previous six months. Rob Bertholee, head of the AIVD, said on EenVandaag that the hackers were Russian and had tried to gain access to secret government documents. https://www.volkskrant.nl/cultuur-media/russen-faalden-bij-hackpogingen-ambtenaren-op-nederlandse-ministeries~b77ff391/
Feb 2017		Russian Hackers ‘Fancy Bear’ Targeted French Presidential Candidate Macron https://www.vice.com/en_us/article/ez35p7/russian-hackers-fancy-bear-targeted-french-presidential-candidate-macron
Feb 2017		IAAF Hack The officials of International Association of Athletics Federations (IAAF) stated in April 2017 that its servers had been hacked by the “Fancy Bear” group. The attack was detected by cybersecurity firm Context Information Security which identified that an unauthorized remote access to IAAF’s servers had taken place on February 21. IAAF stated that the hackers had accessed the <i>Therapeutic Use Exemption</i> applications, needed to use medications prohibited by WADA. https://www.voanews.com/a/iaaf-hack-fancy-bears/3793874.html
Apr 2017		German elections They targeted the German Konrad Adenauer Foundation and Friedrich Ebert Foundation, groups that are associated with Angela Merkel’s Christian Democratic Union and opposition Social Democratic Party, respectively. Fancy Bear set up fake email servers in late 2016 to send phishing emails with links to malware. https://www.handelsblatt.com/today/politics/election-risks-russia-linked-hackers-target-german-political-foundations/23569188.html?ticket=ST-2696734-GRHgtQukDIEXeSOwksXO-ap1
Early to mid 2017		SPLM backdoor Target: included defense related commercial and military organizations, and telecommunications.

		<p>Targeting included TR, KZ, AM, KG, JO, UK, UZ Method: SPLM/CHOPSTICK/Xagent</p>
	Jun 2017	<p>Heavy Zebrocy deployments Targeting profiles, spear-phish filenames, and lures carry thematic content related to visa applications and scanned images, border control administration, and various administrative notes. Targeting appears to be widely spread across the Middle East, Europe, and Asia:</p> <ul style="list-style-type: none">• Business accounting practices and standards• Science and engineering centers• Industrial and hydro chemical engineering and standards/certification• Ministry of foreign affairs• Embassies and consulates• National security and intelligence agencies• Press services• Translation services• NGO – family and social service• Ministry of energy and industry <p>Method: the Zebrocy chain follows a pattern: spear-phish attachment -> compiled Autoit script (downloader) -> Zebrocy payload. In some deployments, we observed Sofacy actively developing and deploying a new package to a much smaller, specific subset of targets within the broader set.</p>
	Jul 2017	<p>APT28 Targets Hospitality Sector, Presents Threat to Travelers <https://www.fireeye.com/blog/threat-research/2017/08/apt28-targets-hospitality-sector.html></p>
	Oct 2017	<p>In this case it capitalized on the recent terrorist attack in New York City. The document itself is blank. Once opened, the document contacts a control server to drop the first stage of the malware, Seduploader, onto a victim's system. <https://securingtomorrow.mcafee.com/mcafee-labs/apt28-threat-group-adopts-dde-technique-nyc-attack-theme-in-latest-campaign/#sf151634298></p>

Sowbug

Names	Sowbug (Symantec)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2015
Description	<p>(Symantec) Symantec has identified a previously unknown group called Sowbug that has been conducting highly targeted cyberattacks against organizations in South America and Southeast Asia and appears to be heavily focused on foreign policy institutions and diplomatic targets. Sowbug has been seen mounting classic espionage attacks by stealing documents from the organizations it infiltrates.</p> <p>Symantec saw the first evidence of Sowbug-related activity with the discovery in March 2017 of an entirely new piece of malware called Felismus used against a target in Southeast Asia. We have subsequently identified further victims on both sides of the Pacific Ocean. While the Felismus tool was first identified in March of this year, its association with Sowbug was unknown until now. Symantec has also been able to connect earlier attack campaigns with Sowbug, demonstrating that it has been active since at least early-2015 and may have been operating even earlier.</p> <p>To date, Sowbug appears to be focused mainly on government entities in South America and Southeast Asia and has infiltrated organizations in Argentina, Brazil, Ecuador, Peru, Brunei and Malaysia. The group is well resourced, capable of infiltrating multiple targets simultaneously and will often operate outside the working hours of targeted organizations in order to maintain a low profile.</p>
Observed	Sectors: Government. Countries: Argentina, Brazil, Brunei, Ecuador, Malaysia and Peru.
Tools used	Felismus and StarLoader.
Information	< https://www.symantec.com/connect/blogs/sowbug-cyber-espionage-group-targets-south-american-and-southeast-asian-governments >

Sphinx

Names	Sphinx (<i>Qihoo 360</i>) APT-C-15 (<i>Qihoo 360</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2014
Description	(<i>Qihoo 360</i>) Operation Sphinx is a cyber-espionage activity in the Middle East. The main victims are political and military organizations in Egypt, Israel and possibly other countries. Sensitive data theft is what the attackers plotted for during the period from June, 2014 to November, 2015 when the activity was in its prime. We encountered some timestamps of the samples to be as early as December, 2011 which suggests the attack might be started much earlier, though further sound proof is needed. The main approach of Sphinx is watering hole attack on social web sites. Until now, we have obtained 314 pieces of sample malicious codes and 7 C2 domains.
Observed	Countries: Egypt and Israel.
Tools used	AnubisSpy, Havex RAT, njRAT and ROCK.

Stealth Falcon, FruityArmor

Names	Stealth Falcon (<i>Citizen Lab</i>) FruityArmor (<i>Kaspersky</i>) Project Raven (<i>Reuters</i>)	
Country	UAE	
Motivation	Information theft and espionage	
First seen	2012	
Description	<p>(Citizen Lab) This report describes a campaign of targeted spyware attacks carried out by a sophisticated operator, which we call Stealth Falcon. The attacks have been conducted from 2012 until the present, against Emirati journalists, activists, and dissidents. We discovered this campaign when an individual purporting to be from an apparently fictitious organization called “The Right to Fight” contacted Rori Donaghy. Donaghy, a UK-based journalist and founder of the Emirates Center for Human Rights, received a spyware-laden email in November 2015, purporting to offer him a position on a human rights panel. Donaghy has written critically of the United Arab Emirates (UAE) government in the past, and had recently published a series of articles based on leaked emails involving members of the UAE government.</p> <p>Circumstantial evidence suggests a link between Stealth Falcon and the UAE government. We traced digital artifacts used in this campaign to links sent from an activist’s Twitter account in December 2012, a period when it appears to have been under government control. We also identified other bait content employed by this threat actor. We found 31 public tweets sent by Stealth Falcon, 30 of which were directly targeted at one of 27 victims. Of the 27 targets, 24 were obviously linked to the UAE, based on their profile information (e.g., photos, “UAE” in account name, location), and at least six targets appeared to be operated by people who were arrested, sought for arrest, or convicted in absentia by the UAE government, in relation to their Twitter activity.</p>	
Observed	Sectors: Civil society groups and Emirati journalists, activists and dissidents. Countries: Netherlands, Saudi Arabia, Thailand, UAE and UK.	
Tools used	StealthFalcon and 0-day exploits.

Strider, ProjectSauron

Names	Strider (<i>Symantec</i>) ProjectSauron (<i>Kaspersky</i>)
Country	USA
Motivation	Information theft and espionage
First seen	2011
Description	<p>(<i>Symantec</i>) Strider has been active since at least October 2011. The group has maintained a low profile until now and its targets have been mainly organizations and individuals that would be of interest to a nation state's intelligence services. Symantec obtained a sample of the group's Remsec malware from a customer who submitted it following its detection by our behavioral engine.</p> <p>Remsec is primarily designed to spy on targets. It opens a back door on an infected computer, can log keystrokes, and steal files.</p> <p>Strider has been highly selective in its choice of targets and, to date, Symantec has found evidence of infections in 36 computers across seven separate organizations. The group's targets include a number of organizations and individuals located in Russia, an airline in China, an organization in Sweden, and an embassy in Belgium.</p>
Observed	Sectors: Defense, Embassies, Financial, Government, Scientific research centers and Telecommunications. Countries: Belgium, China, Iran, Russia, Rwanda and Sweden.
Tools used	Remsec.
Information	< https://www.symantec.com/connect/blogs/strider-cyberespionage-group-turns-eye-sauron-targets > < https://media.kasperskycontenthub.com/wp-content/uploads/sites/43/2018/03/07190154/The-ProjectSauron-APT_research_KL.pdf >
MITRE ATT&CK	< https://attack.mitre.org/groups/G0041/ >

Suckfly

Names	Suckfly (Symantec)	
Country	China	
Motivation	Information theft and espionage	
First seen	2014	
Description	<p>(Symantec) In March 2016, Symantec published a blog on Suckfly, an advanced cyberespionage group that conducted attacks against a number of South Korean organizations to steal digital certificates. Since then we have identified a number of attacks over a two-year period, beginning in April 2014, which we attribute to Suckfly. The attacks targeted high-profile targets, including government and commercial organizations. These attacks occurred in several different countries, but our investigation revealed that the primary targets were individuals and organizations primarily located in India.</p> <p>While there have been several Suckfly campaigns that infected organizations with the group's custom malware Backdoor.Nidiran, the Indian targets show a greater amount of post-infection activity than targets in other regions. This suggests that these attacks were part of a planned operation against specific targets in India.</p>	
Observed	<p>Sectors: E-commerce, Entertainment, Financial, Government, Healthcare, Media, Shipping and Logistics, Software development and Video game development.</p> <p>Countries: India.</p>	
Tools used	gsecdump, Nidiran, smbscan and Windows Credentials Editor.	
Operations performed	Apr 2014	The first known Suckfly campaign began in April of 2014. During our investigation of the campaign, we identified a number of global targets across several industries who were attacked in 2015. Many of the targets we identified were well known commercial organizations located in India. <https://www.symantec.com/connect/blogs/indian-organizations-targeted-suckfly-attacks>
	Late 2015	We discovered Suckfly, an advanced threat group, conducting targeted attacks using multiple stolen certificates, as well as hacktools and custom malware. The group had obtained the certificates through pre-attack operations before commencing targeted attacks against a number of government and commercial organizations spread across multiple continents over a two-year period. This type of activity and the malicious use of stolen certificates emphasizes the importance of safeguarding certificates to prevent them from being used maliciously. <https://www.symantec.com/connect/blogs/suckfly-revealing-secret-life-your-code-signing-certificates>
MITRE ATT&CK	https://attack.mitre.org/groups/G0039/	

Sweed

Names	Sweed (<i>Talos</i>)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2017	
Description	<p>(<i>Talos</i>) Cisco Talos recently identified a large number of ongoing malware distribution campaigns linked to a threat actor we're calling "SWEED," including such notable malware as Formbook, Lokibot and Agent Tesla. Based on our research, SWEED — which has been operating since at least 2017 — primarily targets their victims with stealers and remote access 315tack315.</p> <p>SWEED remains consistent across most of their campaigns in their use of spear-phishing emails with malicious attachments. While these campaigns have featured a myriad of different types of malicious documents, the actor primarily tries to infect its victims with a packed version of Agent Tesla — an information stealer that's been around since at least 2014. The version of Agent Tesla that SWEED is using differs slightly from what we've seen in the past in the way that it is packed, as well as how it infects the system. In this post, we'll run down each campaign we're able to connect to SWEED, and talk about some of the actor's tactics, techniques and procedures (TTPs).</p>	
Observed	<p>Sectors: Defense, Energy, Financial, Human Resources, Shipping and Logistics and Manufacturing.</p> <p>Countries: Bosnia and Herzegovina, Canada, China, Djibouti, France, Germany, Hong Kong, India, Italy, Monaco, Russia, Qatar, Singapore, South Africa, South Korea, Switzerland, Taiwan, Turkey, UAE, UK and USA.</p>	
Tools used	Agent Tesla, Formbook, LokiBot and RDP.	
Operations performed	2017	Steganography One of the earliest SWEED campaigns Talos identified dates back to 2017. In this attack, the actors placed droppers inside of ZIP archives, and then attached those ZIPs to emails. The attachments usually had file names similar to "Java_Updater.zip" or "P-O of Jun2017.zip".
	Jan 2018	In early 2018, we observed that SWEED began leveraging Java-based droppers. Similar to previous campaigns, the JAR was directly attached to emails and used file names such as "Order_2018.jar". The purpose of the JAR was to obtain information about the infected system and facilitate the download of a packed version of Agent Tesla.
	Apr 2018	In April 2018, SWEED began making use of a previously disclosed Office exploit. One of the documents featured in these email campaigns was notable because it was a PowerPoint document (PPXS). Code contained inside one of the slides triggers an exploit for CVE-2017-8759, a remote code execution vulnerability in Microsoft .NET framework.
	May 2018	In May 2018, campaigns being conducted by SWEED began leveraging another vulnerability in Microsoft Office: CVE-2017-11882, a remote code execution bug in Microsoft Office that is commonly observed being leveraged in malicious documents used in commodity malware distribution.

	2019	Beginning in 2019, the campaigns associated with SWEED began leveraging malicious Office macros. As with previous attacks, they are leveraging spear-phishing emails and malicious attachments to initiate the infection process. < https://blog.talosintelligence.com/2019/07/sweed-agent-tesla.html >
Information	< https://blog.talosintelligence.com/2019/07/sweed-agent-tesla.html >	

Syrian Electronic Army (SEA), Deadeye Jackal

Names	Syrian Electronic Army (SEA) (<i>self given</i>) Syria Malware Team (<i>self given</i>) Deadeye Jackal (<i>CrowdStrike</i>) ATK 196 (<i>Thales</i>) TAG-CT2	
Country	Syria	
Motivation	Information theft and espionage	
First seen	2011	
Description	<p>(Qihoo 360) In April 2011, only days after anti-regime protests escalated in Syria, Syrian Electronic Army (SEA) emerged on Facebook to support the government's Syrian President Bashar al-Assad. In May 5, 2011 the Syrian Computer Society registered SEA's website (syrian-es.com). Because Syria's domain registration authority registered the hacker site, some security experts have written that the group was supervised by the Syrian state. SEA claimed on its webpage to be no official entity, but "a group of enthusiastic Syrian youths who could not stay passive towards the massive distortion of facts about the recent uprising in Syria". As soon as May 27, 2011 SEA had removed text that denied it was an official entity. On the new page, the description of "not an official entity" was removed, only says that it was established by a group of young Syrian enthusiasts to combat the use of the Internet, especially people that use of Facebook in Syria to "spread hatred" and "destroy peace".</p> <p>The Syrian Electronic Army uses spam, website defacement, malware, phishing and denial of service attacks against political opposition groups, Western news agencies, human rights groups and seemingly neutral websites for Syrian conflicts. It also attacked government websites in the Middle East and Europe as well as US defense contractors. The Syrian Electronic Army is the first Arab organization to set up a public Internet army on its national network to openly launch cyber-attacks on its enemies.</p> <p>Syrian Electronic Army has 2 subgroups:</p> <ol style="list-style-type: none">1. Subgroup: Goldmouse, APT-C-272. Subgroup: Pat Bear, APT-C-37	
Observed	<p>Sectors: Defense, Government, High-Tech, Media, Retail, Telecommunications and dissidents.</p> <p>Countries: Canada, France, Middle East, UK and USA.</p>	
Tools used	AndoServer, SandroRAT, SilverHawk, SLRat and SpyNote RAT.	
Operations performed	Mid 2016	In recent years, the group has seemingly kept a low profile, but the SEA hasn't ceased activity: it's altered tactics and is now delivering custom Android malware to opponents of the Assad regime for the purposes of surveillance. < https://www.zdnet.com/article/these-hackers-are-using-android-surveillance-malware-to-target-opponents-of-the-syrian-government/ >
	Jan 2018	Lookout researchers have uncovered a long-running surveillance campaign tied to Syrian nation-state actors, which recently started using the novel coronavirus as its newest lure to entice its targets to download malware.

		< https://blog.lookout.com/nation-state-mobile-malware-targets-syrians-with-covid-19-lures >
Counter operations	May 2018	Two Members of Syrian Electronic Army Indicted for Conspiracy < https://www.justice.gov/usao-edva/pr/two-members-syrian-electronic-army-indicted-conspiracy >
Information		< http://blogs.360.cn/post/SEA_role_influence_cyberattacks.html > < https://en.wikipedia.org/wiki/Syrian_Electronic_Army >

Subgroup: Goldmouse, APT-C-27

Names	Goldmouse (<i>Qihoo 360</i>) Golden Rat (<i>Qihoo 360</i>) APT-C-27 (<i>Qihoo 360</i>) ATK 80 (<i>Thales</i>)
Country	Syria
Motivation	Information theft and espionage
First seen	2014
Description	A subgroup of Syrian Electronic Army (SEA) , Deadeye Jackal . (<i>Qihoo 360</i>) On March 17, 2019, 360 Threat Intelligence Center captured a target attack sample against the Middle East by exploiting WinRAR vulnerability (CVE-2018-20250), and it seems that the attack is carried out by the Goldmouse APT group (APT-C-27). There is a decoy Word document inside the archive regarding terrorist attacks to lure the victim into decompressing. When the archive gets decompressed on the vulnerable computer, the embedded njRAT backdoor (Telegram Desktop.exe) will be extracted to the startup folder and then triggered into execution if the victim restarts the computer or performs re-login. After that, the attacker is capable to control the compromised device.
Observed	Countries: Middle East and Syria.
Tool used	GoldenRAT, njRAT and a WinRAR exploit.
Information	< https://ti.360.net/blog/articles/apt-c-27-(goldmouse):-suspected-target-attack-against-the-middle-east-with-winrar-exploit-en/ > < https://blog.360totalsecurity.com/en/the-sample-analysis-of-apt-c-27s-recent-attack/ > < http://blogs.360.cn/post/SEA_role_influence_cyberattacks.html >

Subgroup: Pat Bear, APT-C-37

Names	Pat Bear (<i>Qihoo 360</i>) APT-C-37 (<i>Qihoo 360</i>)
Country	Syria
Motivation	Information theft and espionage
First seen	2015
Description	A subgroup of Syrian Electronic Army (SEA) , Deadeye Jackal . (<i>Qihoo 360</i>) Since October 2015, the Pat Bear Organization (APT-C-37) has launched a well-organized, targeted and persistent attack against the “Islamic State”. Watering hole was used to delivery sample in this attack. The malicious samples were mainly disguised as chat software and some common software in specific fields. This Trojan has many functions such as stealing messages, contacts, WhatsApp and Telegram data, and uploading files using FTP. After reversing and correlation, we found that there is a strong correlation between the Pat Bear Organization and the Golden Rat issue, so this attack activity belongs to another branch of the Syrian Electronic Army.
Observed	Sectors: Defense. Countries: Egypt, Israel and “Islamic State”.
Tool used	DroidJack, H-Worm, njRAT, SpyNote RAT and SSLove RAT.
Information	< http://blogs.360.cn/post/SEA_role_influence_cyberattacks.html > < https://cybersecurity.att.com/blogs/labs-research/alien-labs-2019-analysis-of-threat-groups-molerats-and-apt-c-37#When:14:00:00Z >

TA2101

Names	TA2101 (<i>Proofpoint</i>)
Country	[Unknown]
Motivation	Financial crime, Financial gain
First seen	2019
Description	<p>(Proofpoint) Proofpoint researchers recently detected campaigns from a relatively new actor, tracked internally as TA2101, targeting German companies and organizations to deliver and install backdoor malware.</p> <p>The actor initiated their campaigns impersonating the Bundeszentralamt fur Steuern, the German Federal Ministry of Finance, with lookalike domains, verbiage, and stolen branding in the emails.</p> <p>Proofpoint researchers have also observed this actor distributing Maze ransomware, employing similar social engineering techniques to those it uses for Cobalt Strike, while also targeting organizations in Italy and impersonating the Agenzia Delle Entrate, the Italian Revenue Agency. We have also recently observed the actor targeting organizations in the United States using the IcedID banking Trojan while impersonating the United States Postal Service (USPS).</p>
Observed	Sectors: Construction, Education, Electronics, Energy, Financial, Government, Healthcare, Hospitality, IT, Manufacturing, Media, Oil and gas, Retail, Shipping and Logistics, Technology, Telecommunications, Transportation and logistics. Countries: Canada, Costa Rica, France, Germany, Italy, South Korea, Thailand, UK and USA.

TA428

Names	TA428 (<i>Proofpoint</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2019	
Description	<p>(Proofpoint) Proofpoint researchers initially identified email campaigns with malicious RTF document attachments targeting East Asian government agencies in March 2019. These campaigns originated from adversary-operated free email sender accounts at yahoo[.]co[.].jp and yahoo[.]com. Sender addresses often imitated common names found in the languages of targeted entities. Spear phishing emails included malicious .doc attachments that were actually RTF files saved with .doc file extensions.</p> <p>The lures used in the subjects, attachment names, and attachment content in several cases utilized information technology themes specific to Asia such as governmental or public training documents relating to IT. On one specific occasion an email utilized the subject "ITU Asia-Pacific Online CoE Training Course on 'Conformity & Interoperability in 5G' for the Asia-Pacific Region, 15-26 April 2019" and the attachment name "190315_annex 1 online_course_agenda_coei_c&i.doc". The conference referenced in the lure was an actual event likely selected due to its relevance to potential victims. This is significant as countries in the APAC region continue to adopt Chinese 5G technology in government as well as heavy equipment industries.</p>	
Observed	<p>Sectors: Government. Countries: East Asia.</p>	
Tools used	8.t Dropper, Cotx RAT and Poison Ivy.	
Operations performed	Mar 2019	Operation "LagTime IT" Attackers relied on Microsoft Equation Editor exploit CVE-2018-0798 to deliver a custom malware that Proofpoint researchers have dubbed Cotx RAT. Additionally, this APT group utilizes Poison Ivy payloads that share overlapping command and control (C&C) infrastructure with the newly identified Cotx campaigns. <https://www.proofpoint.com/us/threat-insight/post/chinese-apt-operation-lagtime-it-targets-government-information-technology>

TA459

Names	TA459 (<i>Proofpoint</i>)
Country	China
Motivation	Information theft and espionage
First seen	2017
Description	<p>(Proofpoint) On April 20 [2017], Proofpoint observed a targeted campaign focused on financial analysts working at top global financial firms operating in Russia and neighboring countries. These analysts were linked by their coverage of the telecommunications industry, making this targeting very similar to, and likely a continuation of, activity described in our “In Pursuit of Optical Fibers and Troop Intel” blog. This time, however, attackers opportunistically used spear-phishing emails with a Microsoft Word attachment exploiting the recently patched CVE-2017-0199 to deploy the ZeroT Trojan, which in turn downloaded the PlugX Remote Access Trojan (RAT).</p> <p>Proofpoint is tracking this attacker, believed to operate out of China, as TA459. The actor typically targets Central Asian countries, Russia, Belarus, Mongolia, and others. TA459 possesses a diverse malware arsenal including PlugX, NetTraveler, and ZeroT.</p>
Observed	Sectors: Financial and Telecommunications. Countries: Central Asia, Belarus, Mongolia, Russia and others.
Tools used	Gh0st RAT, NetTraveler, PlugX and ZeroT.
Information	< https://www.proofpoint.com/us/threat-insight/post/apt-targets-financial-analysts >

TA505, Graceful Spider, Gold Evergreen

Names	TA505 (<i>Proofpoint</i>) Graceful Spider (<i>CrowdStrike</i>) Gold Evergreen (<i>SecureWorks</i>) TEMP.Warlock (<i>FireEye</i>) ATK 103 (<i>Thales</i>) SectorJ04 (<i>ThreatRecon</i>) Hive0065 (<i>IBM</i>) Chimborazo (<i>Microsoft</i>)
Country	Russia
Motivation	Financial crime, Financial gain
First seen	2006
Description	<p>(Proofpoint) Proofpoint researchers track a wide range of threat actors involved in both financially motivated cybercrime and state-sponsored actions. One of the more prolific actors that we track – referred to as TA505 – is responsible for the largest malicious spam campaigns we have ever observed, distributing instances of the Dridex banking Trojan, Locky ransomware, Jaff ransomware, The Trick banking Trojan, and several others in very high volumes.</p> <p>Because TA505 is such a significant part of the email threat landscape, this blog provides a retrospective on the shifting malware, payloads, and campaigns associated with this actor. We examine their use of malware such as Jaff, Bart, and Rockloader that appear to be exclusive to this group as well as more widely distributed malware like Dridex and Pony. Where possible, we detail the affiliate models with which they are involved and outline the current state of TA505 campaigns.</p> <p>TA505 is arguably one of the most significant financially motivated threat actors because of the extraordinary volumes of messages they send. The variety of malware delivered by the group also demonstrates their deep connections to the underground malware scene. At the time of writing, Locky ransomware remains their malware of choice, even as the group continues to experiment with a variety of additional malware.</p> <p>Much of the malware from TA505 has been observed to be distributed using Avalanche, Cutwail (operated by Narwhal Spider), Necurs (operated by Monty Spider) and Emotet (operated by Mummy Spider, TA542).</p> <p>TA505 also has some infrastructure overlap with Buhtrap, Ratopak Spider and Group-IB found several relationships with Silence, Contract Crew.</p> <p>Some of the development of TA505 appears to have been done by a subgroup named Indrik Spider and, by extension, Doppel Spider.</p> <p>See also: Dungeon Spider.</p>
Observed	Sectors: Education, Financial, Healthcare, Hospitality and Retail. Countries: Worldwide.
Tools used	Amadey, AndroMut, Bart, Clop, CryptoLocker, CryptoMix, Dridex, Dudear, EmailStealer, FlawedAmmyy, FlawedGrace, FlowerPippi, GameOver Zeus, Gelup, Get2, GlobalImposter, Jaff, Kegotip, Locky, MINEBRIDGE, Neutrino, Philadelphia,

	Pony, RockLoader, RMS, SDBbot, ServHelper, Shifu, Snatch, TinyMet, Zeus and Living off the Land.	
Operations performed	Oct 2017	On October 10, TA505 introduced their first geo-targeted campaign dropping either Locky or The Trick banking Trojan. In this campaign, HTML files were attached to emails inquiring about the status of an invoice. <https://www.proofpoint.com/us/threat-insight/post/ta505-shifts-times>
	Jun 2018	We first observed an actor embedding SettingContent-ms inside a PDF on June 18. However, on July 16 we observed a particularly large campaign with hundreds of thousands of messages attempting to deliver PDF attachments with an embedded SettingContent-ms file. <https://www.proofpoint.com/us/threat-insight/post/ta505-abusing-settingcontent-ms-within-pdf-files-distribute-flawedammyy-rat>
	Nov 2018	Since November 15, 2018, Proofpoint began observing email campaigns from a specific actor targeting large retail chains, restaurant chains and grocery chains, as well as other organizations in the food and beverage industries. <https://www.proofpoint.com/us/threat-insight/post/ta505-targets-us-retail-industry-personalized-attachments>
	Nov 2018	ServHelper and FlawedGrace – New malware introduced by TA505 <https://www.proofpoint.com/us/threat-insight/post/servhelper-and-flawedgrace-new-malware-introduced-ta505>
	Dec 2018	In mid-December 2018 a spear-phishing campaign was detected as targeting large US-based retailers along with organizations in the food and beverage industry. Masquerading as a legitimate communication sent from a Ricoh printer, the initial email lured victims into opening an attached malicious Microsoft Word document.
	Dec 2018	Last month, 360 Threat Intelligence Center captured multiple phishing emails sent by TA505 Group to target financial institutions. These phishing emails contain Excel attachments with Excel 4.0 Macro embedded and download Backdoor at last. <https://ti.360.net/blog/articles/excel-4.0-macro-utilized-by-ta505-to-target-financial-institutions-recently-en/>
	Apr 2019	LOLBins and a New Backdoor Malware <https://www.cybereason.com/blog/threat-actor-ta505-targets-financial-enterprises-using-lolbins-and-a-new-backdoor-malware>
	Apr 2019	While monitoring their activities, we found that the group is still updating their tactics, techniques, and procedures (TTPs). In April, TA505 targeted Latin American countries Chile and Mexico, and even Italy using either FlawedAmmyy RAT or RMS RAT as payload. By the end of April, we learned that the group started to go after targets in East Asian countries such as China, South Korea, and Taiwan using FlawedAmmyy RAT as its payload. <https://blog.trendmicro.com/trendlabs-security-intelligence/shifting-tactics-breaking-down-ta505-groups-use-of-html-rats-and-other-techniques-in-latest-campaigns/>
	May 2019	During the last month our Threat Intelligence surveillance team spotted increasing evidence of an operation intensification against the Banking sector.

		< https://blog.yoroi.company/research/the-stealthy-email-stealer-in-the-ta505-arsenal/ >
May 2019		In the last few days, during monitoring activities, Yoroi CERT noticed a suspicious attack against an Italian organization. The malicious email contains a highly suspicious sample which triggered the ZLAB team to investigate its capabilities and its possible attribution, discovering a potential expansion of the TA505 operation. < https://blog.yoroi.company/research/ta505-is-expanding-its-operations/ >
Jun 2019		In June 2019, TA505 appears to have introduced yet another new downloader malware, AndroMut, which has some similarities in code and behavior to Andromeda, a long-established malware family. < https://www.proofpoint.com/us/threat-insight/post/ta505-begins-summer-campaigns-new-pet-malware-downloader-andromut-uae-south >
Jun 2019		Latest Spam Campaigns from TA505 Now Using New Malware Tools Gelup and FlowerPippi < https://blog.trendmicro.com/trendlabs-security-intelligence/latest-spam-campaigns-from-ta505-now-using-new-malware-tools-gelup-and-flowerpippi/ >
Aug 2019		Given the group's active campaigns since our updates in June and July, we continued following their latest campaigns. Just like in previous operations, they continue to make small changes, such as targeting other countries, entities, or the combination of techniques used for deployment, for each campaign. < https://blog.trendmicro.com/trendlabs-security-intelligence/ta505-at-it-again-varietiy-is-the-spice-of-servhelper-and-flawedammyy/ >
Sep 2019		In September 2019, Proofpoint researchers observed a prolific threat actor, TA505, sending email campaigns that attempt to deliver and install Get2, a new downloader. Get2 was, in turn, observed downloading FlawedGrace, FlawedAmmyy, Snatch, and SDBbot (a new RAT) as secondary payloads. < https://www.proofpoint.com/us/threat-insight/post/ta505-distributes-new-sdbbot-remote-access-trojan-get2-downloader >
Dec 2019		Ransomware 328ttack on Maastricht University < https://www.bleepingcomputer.com/news/security/ta505-hackers-behind-maastricht-university-ransomware-attack >
Dec 2019		Throughout January 2020, FireEye has continued to observe multiple targeted phishing campaigns designed to download and deploy a backdoor we track as MINEBRIDGE. < https://www.fireeye.com/blog/threat-research/2020/01/stomp-2-dis-brilliance-in-the-visual-basics.html >
2019		TA505 hacking crew spent much of 2019 trying to breach South Korea's financial sector < https://www.cyberscoop.com/ta505-south-korea-bank-phishing >
2019		In this newly discovered campaign from TA505, threat actors targeted German companies with trojanized emails disguised as job applicants. While this activity appeared to be geographically based in Germany, these same techniques could easily be applied to any organization.

		Once the email attachment was activated, a company's secure credentials and credit card data could be transmitted covertly to the threat actors. In the 2019 iterations of this attack, TA505 used commercial tools to encrypt all the users files, which suggests this recent activity could also lay the groundwork for an infection vector into the company's network to encrypt files. <https://blog.prevailion.com/2020/03/the-curious-case-of-criminal-curriculum.html>
	Jan 2020	Microsoft says that an ongoing TA505 phishing campaign is using attachments featuring HTML redirectors for delivering malicious Excel documents, this being the first time the threat actors have been seen adopting this technique. <https://www.bleepingcomputer.com/news/security/microsoft-detects-new-ta505-malware-attacks-after-short-break/>
	Mar 2020	U.S. pharmaceutical giant ExecuPharm has become the latest victim of data-stealing ransomware. ExecuPharm said in a letter to the Vermont attorney general's office that it was hit by a ransomware attack on March 13, and warned that Social Security numbers, financial information, driver licenses, passport numbers and other sensitive data may have been accessed. But TechCrunch has now learned that the ransomware group behind the attack has published the data stolen from the company's servers. <https://techcrunch.com/2020/04/27/execupharm-clop-ransomware/>

TA530

Names	TA530 (<i>Proofpoint</i>)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2016	
Description	<p>(Proofpoint) Since January 2016, a financially motivated threat actor whom Proofpoint has been tracking as TA530 has been targeting executives and other high-level employees, often through campaigns focused exclusively on a particular vertical. For example, intended victims frequently have titles of Chief Financial Officer, Head of Finance, Senior Vice President, Director and other high level roles.</p> <p>Additionally, TA530 customizes the email to each target by specifying the target's name, job title, phone number, and company name in the email body, subject, and attachment names. On several occasions, we verified that these details are correct for the intended victim. While we do not know for sure the source of these details, they frequently appear on public websites, such as LinkedIn or the company's own website. The customization doesn't end with the lure; the malware used in the campaigns is also targeted by region and vertical.</p>	
Observed	<p>Sectors: Automotive, Construction, Education, Energy, Engineering, Financial, Food and Agriculture, Healthcare, Hospitality, Manufacturing, Media, Pharmaceutical, Retail, Technology, Telecommunications, Transportation and Utilities.</p> <p>Countries: Australia, UK and USA.</p>	
Tools used	AbaddonPOS, August Stealer, CryptoWall, Dridex, Gozi ISFB, H1N1 Loader, Nymaim, Smoke Loader, TeamSpy, TinyLoader.	
Operations performed	Nov 2016	August in November: New Information Stealer Hits the Scene <https://www.proofpoint.com/uk/threat-insight/post/august-in-december-new-information-stealer-hits-the-scene>
Information	<https://www.proofpoint.com/us/threat-insight/post/phish-scales-malicious-actor-target-execs>	

TA555

Names	TA555 (<i>Proofpoint</i>)
Country	[Unknown]
Motivation	Financial crime
First seen	2018
Description	(Proofpoint) Beginning in May 2018, Proofpoint researchers observed a previously undocumented downloader dubbed AdvisorsBot appearing in malicious email campaigns. The campaigns appear to primarily target hotels, restaurants, and telecommunications, and are distributed by an actor we track as TA555. To date, we have observed AdvisorsBot used as a first-stage payload, loading a fingerprinting module that, as with Marap, is presumably used to identify targets of interest to further infect with additional modules or payloads. AdvisorsBot is under active development and we have also observed another version of the malware completely rewritten in PowerShell and .NET.
Observed	Sectors: Hospitality and Telecommunications.
Tools used	AdvisorsBot and PoshAdvisor.
Information	< https://www.proofpoint.com/us/threat-insight/post/new-modular-downloaders-fingerprint-systems-part-2-advisorsbot >

Taidoor

Names	Taidoor (<i>Trend Micro</i>)
Country	China
Motivation	Information theft and espionage
First seen	2009
Description	<p>(<i>Trend Micro</i>) The Taidoor attackers have been actively engaging in targeted attacks since at least March 4, 2009. Despite some exceptions, the Taidoor campaign often used Taiwanese IP addresses as C&C servers and email addresses to send out socially engineered emails with malware as attachments. One of the primary targets of the Taidoor campaign appeared to be the Taiwanese government. The attackers spoofed Taiwanese government email addresses to send out socially engineered emails in the Chinese language that typically leveraged Taiwan-themed issues. The attackers actively sent out malicious documents and maintained several IP addresses for command and control.</p> <p>As part of their social engineering ploy, the Taidoor attackers attach a decoy document to their emails that, when opened, displays the contents of a legitimate document but executes a malicious payload in the background.</p> <p>We were only able to gather a limited amount of information regarding the Taidoor attackers' activities after they have compromised a target. We did, however, find that the Taidoor malware allowed attackers to operate an interactive shell on compromised computers and to upload and download files. In order to determine the operational capabilities of the attackers behind the Taidoor campaign, we monitored a compromised honeypot. The attackers issued out some basic commands in an attempt to map out the extent of the network compromise but quickly realized that the honeypot was not an intended targeted and so promptly disabled the Taidoor malware running on it. This indicated that while Taidoor malware were more widely distributed compared with those tied to other targeted campaigns, the attackers could quickly assess their targets and distinguish these from inadvertently compromised computers and honeypots.</p>
Observed	Sectors: Government. Countries: Taiwan.
Tools used	Taidoor.
Information	< https://www.trendmicro.de/cloud-content/us/pdfs/security-intelligence/white-papers/wp_the_taidoor_campaign.pdf >
MITRE ATT&CK	< https://attack.mitre.org/groups/G0015/ >

TaskMasters

Names	TaskMasters (<i>Positive Technologies</i>)
Country	China
Motivation	Information theft and espionage
First seen	2010
Description	<p>(Positive Technologies) The main objective of the group is to steal confidential information. The attackers attempt to burrow into corporate information systems for extended periods and obtain access to key servers, executive workstations, and business-critical systems.</p> <p>At one of the attacked companies, the earliest traces of the group's presence on infrastructure dated to 2010. Since the group had obtained full control of some servers and workstations by that time, the initial breach must have occurred much earlier.</p> <p>Most of the attacked companies relate to manufacturing and industry. In total we are aware of compromise of over 30 companies and organizations in various sectors, including:</p> <ul style="list-style-type: none">• Manufacturing and industry• Energy• Government• Science and technology• Systems integration• Software development• Geology• Transport and logistics• Real estate• Construction <p>The group attacked companies in a number of countries. A significant number of their targets were located in Russia and the CIS.</p>
Observed	Sectors: Construction, Energy, Government, IT, Manufacturing, Shipping and Logistics, Technology, Transportation, Systems integration and Real estate. Countries: Russia and CIS.
Tool used	404-Input-shell web shell, ASPXSpy, AtNow, DbxDump Utility, gsecdump, HTran, jsp File browser, Mimikatz, nbtscan, PortScan, ProcDump, PsExec, PsList, pwdump, reGeorg, RemShell and RemShell Downloader.

TeamSpy Crew

Names	TeamSpy Crew (Kaspersky) SIG39 (NSA) Iron Lyric (SecureWorks)	
Country	Russia	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>(Kaspersky) Researchers have uncovered a long-term cyber-espionage campaign that used a combination of legitimate software packages and commodity malware tools to target a variety of heavy industry, government intelligence agencies and political activists. Known as the TeamSpy crew because of its affinity for using the legitimate TeamViewer application as part of its toolset, the attackers may have been active for as long as 10 years, researchers say.</p> <p>The attack appears to be a years-long espionage campaign, but experts who have analyzed the victim profile, malware components and command-and-control infrastructure say that it's not entirely clear what kind of data the attackers are going after. What is clear, though, is that the attackers have been at this for a long time and that they have specific people in mind as targets.</p> <p>Researchers at the CrySyS Lab in Hungary were alerted by the Hungarian National Security Authority to an attack against a high-profile target in the country and began looking into the campaign. They quickly discovered that some of the infrastructure being used in the attack had been in use for some time and that the target they were investigating was by no means the only one.</p>	
Observed	Sectors: Education, Electronics, Government, Industrial and high-profile targets. Countries: Algeria, Australia, Bangladesh, Belgium, Benin, Bhutan, Brazil, Cameroon, Canada, Central-African Republic, Chad, China, Congo, Costa Rica, Cote d'Ivoire, Croatia, Djibouti, Egypt, France, Gabon, Georgia, Germany, Hungary, India, Indonesia, Iran, Italy, Japan, Kazakhstan, Kenya, Madagascar, Mali, Mauritania, Mongolia, Morocco, Nepal, Netherlands, Norway, Peru, Philippines, Portugal, Romania, Russia, Saudi Arabia, Senegal, Slovakia, South Africa, Spain, Sudan, Sweden, Switzerland, Tanzania, Thailand, Tunisia, Turkey, UK, Ukraine, USA and Vietnam.	
Tools used	TeamSpy, TeamViewer and JAVA RATs.	
Operations performed	Feb 2017	A new spam campaign emerged over the weekend, carrying the TeamSpy data-stealing malware, which can give cybercriminals full access to a compromised computer. https://heimdalsecurity.com/blog/security-alert-teamspy-turn-teamviewer-into-spying-tool/

TeleBots

Names	TeleBots (ESET)	
Country	Russia	
Sponsor	State-sponsored	
Motivation	Sabotage and destruction	
First seen	2015	
Description	<p>(ESET) In the second half of 2016, ESET researchers identified a unique malicious toolset that was used in targeted cyberattacks against high-value targets in the Ukrainian financial sector. We believe that the main goal of attackers using these tools is cybersabotage. This blog post outlines the details about the campaign that we discovered.</p> <p>We will refer to the gang behind the malware as TeleBots. However it's important to say that these attackers, and the toolset used, share a number of similarities with the BlackEnergy group, which conducted attacks against the energy industry in Ukraine in December 2015 and January 2016. In fact, we think that the BlackEnergy group has evolved into the TeleBots group.</p> <p>This group appears to be closely associated with, or evolved from, Sandworm Team, Iron Viking, Voodoo Bear.</p>	
Observed	Sectors: Financial, Software companies and Transportation. Countries: Ukraine and Worldwide (NotPetya).	
Tools used	BadRabbit, BlackEnergy, CredRaptor, Exaramel, FakeTC, Felixroot, GreyEnergy, KillDisk, NotPetya, TeleBot, TeleDoor and Living off the Land.	
Operations performed	Dec 2016	These recent ransomware KillDisk variants are not only able to target Windows systems, but also Linux machines, which is certainly something we don't see every day. This may include not only Linux workstations but also servers, amplifying the damage potential. https://www.welivesecurity.com/2017/01/05/killdisk-now-targeting-linux-demands-250k-ransom-cant-decrypt/
	Mar 2017	In 2017, the TeleBots group didn't stop their cyberattacks; in fact, they became more sophisticated. In the period between January and March 2017 the TeleBots attackers compromised a software company in Ukraine (not related to M.E. Doc), and, using VPN tunnels from there, gained access to the internal networks of several financial institutions. https://www.welivesecurity.com/2017/06/30/telebots-back-supply-chain-attacks-against-ukraine/
	May 2017	XData ransomware making rounds amid global WannaCryptor scare A week after the global outbreak of WannaCryptor, also known as WannaCry, another ransomware variant has been making the rounds. Detected by ESET as Win32/Filecoder.AESNI.C, and also known as Xdata ransomware, the threat has been most prevalent in Ukraine, with 96% of the total detections between May 17 th and May 22 th , and peaking on Friday, May 19 th . ESET has protected its customers against this threat since May 18 th . https://www.welivesecurity.com/2017/05/23/xdata-ransomware-making-rounds-amid-global-wannacryptor-scare/

Temper Panda, admin@338

Names	Temper Panda (<i>Crowdstrike</i>) admin@338 (<i>FireEye</i>) Team338 (<i>Kaspersky</i>) Magnesium (<i>Microsoft</i>)
Country	China
Motivation	Information theft and espionage
First seen	2014
Description	<p>(FireEye) The threat group has previously used newsworthy events as lures to deliver malware. They have largely targeted organizations involved in financial, economic and trade policy, typically using publicly available RATs such as Poison Ivy, as well some non-public backdoors.</p> <p>The group started targeting Hong Kong media companies, probably in response to political and economic challenges in Hong Kong and China. The threat group's latest activity coincided with the announcement of criminal charges against democracy activists. During the past 12 months, Chinese authorities have faced several challenges, including large-scale protests in Hong Kong in late 2014, the precipitous decline in the stock market in mid-2015, and the massive industrial explosion in Tianjin in August 2015. In Hong Kong, the pro-democracy movement persists, and the government recently denied a professor a post because of his links to a pro-democracy leader.</p>
Observed	Sectors: Defense, Financial, Government, Media and Think Tanks. Countries: Hong Kong and USA.
Tools used	Bozok, BUBBLEWRAP, LOWBALL, Poison Ivy and Living off the Land.

Tempting Cedar Spyware

Names	Tempting Cedar Spyware (Avast)
Country	Lebanon
Motivation	Information theft and espionage
First seen	2015
Description	<p>(ZDNet) A hacking campaign used fake Facebook profiles to trick targets into downloading malware capable of stealing vast swathes of information, including messages, photos, audio recordings and even the exact location of victims.</p> <p>The group has been operating since as early as 2015 and is thought to have infected the Android phones of hundreds selected targets across the Middle East. The highest concentration of infections is in Israel, but victims have also been seen in the US, China, Germany and France.</p> <p>Uncovered by researchers at Avast, the operation has been dubbed 'Tempting Cedar Spyware'. The name combines the main means of attack - by tricking victims using fake social media profiles purporting to be those of a young woman - with the Cedar tree, which features prominently on the flag of Lebanon.</p> <p>The campaign for distributing the malware begins with fake Facebook profiles which are designed to lure in victims - predominantly men - with 'flirty' conversations.</p>
Observed	Countries: China, France, Germany, Israel and USA.
Tools used	Tempting Cedar Spyware.

Tonto Team, HartBeat, Karma Panda

Names	Tonto Team (<i>FireEye</i>) HeartBeat (<i>Trend Micro</i>) Karma Panda (<i>CrowdStrike</i>) CactusPete (<i>Kaspersky</i>) LoneRanger	
Country	China	
Sponsor	State-sponsored, Shenyang Military Region Technical Reconnaissance Bureau, possibly Unit 65017	
Motivation	Information theft and espionage	
First seen	2009	
Description	<p>(<i>Trend Micro</i>) The first HeartBeat campaign remote access tool (RAT) component was discovered in June 2012 in a Korean newspaper company network. Further investigation revealed that the campaign has been actively distributing their RAT component to their targets in 2011 and the first half of 2012. Furthermore, we uncovered one malware component that dates back to November 2009. This indicates that the campaign started during that time or earlier.</p> <p>The HeartBeat campaign appears to target government organizations and institutions or communities that are in some way related to the South Korean government. Specifically, we were able to identify the following targets:</p> <ul style="list-style-type: none">• Political parties• Media outfits• A national policy research institute• A military branch of South Korean armed forces• A small business sector organization• Branches of South Korean government <p>The profile of their targets suggests that the motive behind the campaign may be politically motivated.</p> <p>(<i>Kaspersky</i>) The actor has quite likely relied on much the same codebase and implant variants for the past six years. However these have broadened substantially since 2018. The group spear-phishes its targets, deploys Word and Equation Editor exploits and an appropriated/repackaged DarkHotel VBScript zero-day, delivers modified and compiled unique Mimikatz variants, GSEC and WCE credential stealers, a keylogger, various Escalation of Privilege exploits, various older utilities and an updated set of backdoors, and what appear to be new variants of custom downloader and backdoor modules.</p>	
Observed	Sectors: Defense, Government, IT and Media. Countries: India, Japan, Mongolia, Russia, South Korea, Taiwan and USA.

Transparent Tribe, APT 36

Names	Transparent Tribe (<i>Proofpoint</i>) APT 36 (<i>Mandiant</i>) ProjectM (<i>Palo Alto</i>) Mythic Leopard (<i>CrowdStrike</i>) TEMP.Lapis (<i>FireEye</i>)	
Country	Pakistan	
Motivation	Information theft and espionage	
First seen	2016	
Description	<p>(Proofpoint) Proofpoint researchers recently uncovered evidence of an advanced persistent threat (APT) against Indian diplomatic and military resources. Our investigation began with malicious emails sent to Indian embassies in Saudi Arabia and Kazakhstan but turned up connections to watering hole sites focused on Indian military personnel and designed to drop a remote access Trojan (RAT) with a variety of data exfiltration functions. Our analysis shows that many of the campaigns and attacks appear related by common IOCs, vectors, payloads, and language, but the exact nature and attribution associated with this APT remain under investigation.</p> <p>At this time, the background and analysis in this paper provide useful forensics and detail our current thinking on the malware that we have dubbed “MSIL/Crimson”.</p> <p>Transparent Tribe may be related to Gorgon Group.</p> <p>Transparant Tribe has been observed to use the Andromeda botnet (operated by Andromeda Spider).</p>	
Observed	Sectors: Defense, Embassies and Government. Countries: Afghanistan, India, Kazakhstan and Saudi Arabia.	
Tools used	beendoor, Bezigate, Bozok, BreachRAT, Crimson RAT, DarkComet, Luminosity RAT, njRAT, Peppy RAT, SilentCMD, Stealth Mango, UPDATESEE and USBWorm.	
Operations performed	Feb 2016	Operation “Transparent Tribe” On February 11, 2016, we discovered two attacks minutes apart directed towards officials at Indian embassies in both Saudi Arabia and Kazakhstan. Both e-mails (Fig. 1, 2) were sent from the same originating IP address (5.189.145[.]248) belonging to Contabo GmbH, a hosting provider that seems to be currently favored by these threat actors. The e-mails also likely utilized Rackspace’s MailGun service and both of them were carrying the same exact attachment. <https://www.proofpoint.com/sites/default/files/proofpoint-operation-transparent-tribe-threat-insight-en.pdf>
	Mar 2016	Indian TV station CNN-IBN has discovered that Pakistani officials were collecting data about Indian troop movements using an Android app called SmeshApp. <https://news.softpedia.com/news/smashapp-removed-from-play-store-because-pakistan-used-it-to-spy-on-indian-army-501936.shtml>
	Mar 2016	Operation “C-Major” Trend Micro is reporting on a third campaign, which they’ve named Operation C-Major. According to the security firm, this campaign

		targeted Indian military officials via spear-phishing emails, distributing spyware to its victims via an Adobe Reader vulnerability. < https://news.softpedia.com/news/another-case-of-a-pakistani-apt-spionage-on-indian-military-personnel-502093.shtml > < https://blog.trendmicro.com/trendlabs-security-intelligence/operation-c-major-actors-also-used-android-blackberry-mobile-spyware-targets/ >
	Feb 2017	This blog post describes another attack campaign where attackers impersonated identity of Indian think tank IDSA (Institute for Defence Studies and Analyses) and sent out spear-phishing emails to target officials of the Central Bureau of Investigation (CBI) and possibly the officials of Indian Army. < https://cysinfo.com/cyber-attack-targeting-cbi-and-possibly-indian-army-officials/ >
	Jan 2020	Transparent tribe is back with a new campaign after several years of (apparently) inactivity. We can confirm that this campaign is completely new, relying on the registration record of the C2 that dates back to 29 January 2020. < https://blog.yoroi.company/research/transparent-tribe-four-years-later/ >
	Early 2020	TransparentTribe started using a new module named USBWorm at the beginning of 2020, as well as improving its custom .NET tool named CrimsonRAT. < https://securelist.com/apt-trends-report-q1-2020/96826/ >

Tropic Trooper, Pirate Panda, APT 23, KeyBoy

Names	Tropic Trooper (<i>Trend Micro</i>) Pirate Panda (<i>CrowdStrike</i>) APT 23 (<i>Mandiant</i>) Iron (<i>Microsoft</i>) KeyBoy (<i>Rapid7</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2011	
Description	Tropic Trooper is an unaffiliated threat group that has led targeted campaigns against targets in Taiwan, the Philippines, and Hong Kong. Tropic Trooper focuses on targeting government, healthcare, transportation, and high-tech industries and has been active since 2011.	
Observed	Sectors: Defense, Government, Healthcare, High-Tech and Transportation. Countries: Hong Kong, India, Philippines, Taiwan, Tibet and Vietnam.	
Tools used	CREDRIVER, KeyBoy, PCShare, Poison Ivy, Titan, USBferry, Yahoyah and Winsloader.	
Operations performed	2012	Operation “Tropic Trooper” Taiwan and the Philippines have become the targets of an ongoing campaign called “Operation Tropic Trooper.” Active since 2012, the attackers behind the campaign have set their sights on the Taiwanese government as well as a number of companies in the heavy industry. The same campaign has also targeted key Philippine military agencies. <https://www.trendmicro.de/cloud-content/us/pdfs/security-intelligence/white-papers/wp-operation-tropic-trooper.pdf>
	Jun 2013	KeyBoy, Targeted Attacks against Vietnam and India https://blog.rapid7.com/2013/06/07/keyboy-targeted-attacks-against-vietnam-and-india/
	2014	New Strategy Tropic Trooper (also known as KeyBoy) levels its campaigns against Taiwanese, Philippine, and Hong Kong targets, focusing on their government, healthcare, transportation, and high-tech industries. https://blog.trendmicro.com/trendlabs-security-intelligence/tropic-trooper-new-strategy/
	Dec 2014	We found that Tropic Trooper’s latest activities center on targeting Taiwanese and the Philippine military’s physically isolated networks through a USBferry attack (the name derived from a sample found in a related research). We also observed targets among military/navy agencies, government institutions, military hospitals, and even a national bank. The group employs USBferry, a USB malware that performs different commands on specific targets, maintains stealth in environments, and steals critical data through USB storage. https://blog.trendmicro.com/trendlabs-security-intelligence/tropic-troopers-back-usbferry-attack-targets-air-gapped-environments/

	Mar 2015	Throughout March to May 2015, our researchers noted that 62% of the Tropic Trooper-related malware infections targeted Taiwanese organizations while the remaining 38% zoned in on Philippine entities. https://blog.trendmicro.com/trendlabs-security-intelligence/operation-tropic-trooper-old-vulnerabilities-still-pack-a-punch/
	Aug 2016	In early August, Unit 42 identified two attacks using similar techniques. The more interesting one was a targeted attack towards the Secretary General of Taiwan's Government office – Executive Yuan. The Executive Yuan has several individual boards which are formed to enforce different executing functions of the government. The Executive Yuan Council evaluates statutory and budgetary bills and bills concerning martial law, amnesty, declaration of war, conclusion of peace and treaties, and other important affairs. https://unit42.paloaltonetworks.com/unit42-tropic-trooper-targets-taiwanese-government-and-fossil-fuel-provider-with-poison-ivy/

Names	Turla (<i>Kaspersky</i>) Waterbug (<i>Symantec</i>) Venomous Bear (<i>CrowdStrike</i>) Group 88 (<i>Talos</i>) SIG2 (<i>NSA</i>) SIG15 (<i>NSA</i>) SIG23 (<i>NSA</i>) Iron Hunter (<i>SecureWorks</i>) Pacifier APT (<i>Bitdefender</i>) ATK 13 (<i>Thales</i>) ITG12 (<i>IBM</i>) Makersmark (<i>ESET</i>) Krypton (<i>Microsoft</i>) Popeye Wraith TAG-0530
Country	Russia
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	1996
Description	Turla is a Russian-based threat group that has infected victims in over 45 countries, spanning a range of industries including government, embassies, military, education, research and pharmaceutical companies since 2004. Heightened activity was seen in mid-2015. Turla is known for conducting watering hole and spear-phishing campaigns and leveraging in-house tools and malware. Turla's espionage platform is mainly used against Windows machines, but has also been seen used against macOS and Linux machines.
Observed	Sectors: Aerospace, Defense, Education, Embassies, Energy, Government, High-Tech, IT, Media, NGOs, Pharmaceutical, Research and Retail. Countries: Afghanistan, Algeria, Armenia, Australia, Austria, Azerbaijan, Belarus, Belgium, Bolivia, Botswana, Brazil, China, Chile, Denmark, Ecuador, Estonia, Finland, France, Georgia, Germany, Hong Kong, Hungary, India, Indonesia, Iran, Iraq, Italy, Jamaica, Jordan, Kazakhstan, Kyrgyzstan, Kuwait, Latvia, Mexico, Netherlands, Pakistan, Paraguay, Poland, Qatar, Romania, Russia, Serbia, Spain, Saudi Arabia, South Africa, Sweden, Switzerland, Syria, Tajikistan, Thailand, Tunisia, Turkmenistan, UK, Ukraine, Uruguay, USA, Uzbekistan, Venezuela, Vietnam and Yemen.

	1996 Operation "Moonlight Maze"

Operations performed	<p>That is why our experts, aided by researchers from King's College London, have carefully studied Moonlight Maze — one of the first widely known cyberespionage campaigns, active since at least 1996. It is of particular interest because several independent experts from countries have voiced the proposition that it is associated with a much more modern — and still active — group, the authors of the Turla APT attack.</p> <p><https://www.kaspersky.com/blog/moonlight-maze-the-lessons/6713/></p>
Nov 2008	Breach of the US Department of Defense < https://www.nytimes.com/2010/08/26/technology/26cyber.html >
2013	Breach of the Finnish Foreign Ministry < https://yle.fi/uutiset/osasto/news/russian_group_behind_2013_foreign_ministry_hack/8591548 >
2013	Operation “Epic Turla” Over the last 10 months, Kaspersky Lab researchers have analyzed a massive cyber-espionage operation which we call “Epic Turla”. The attackers behind Epic Turla have infected several hundred computers in more than 45 countries, including government institutions, embassies, military, education, research and pharmaceutical companies. < https://securelist.com/the-epic-turla-operation/65545/ >
2014	Breach of the Swiss military firm RUAG < https://www.melani.admin.ch/melani/en/home/dokumentation/reports/technical-reports/technical-report_apt_case_ruag.html >
Dec 2014	Operation “Penguin Turla” The Turla APT campaigns have a broader reach than initially anticipated after the recent discovery of two modules built to infect servers running Linux. Until now, every Turla sample in captivity was designed for either 32- or 64-bit Windows systems, but researchers at Kaspersky Lab have discovered otherwise. < https://threatpost.com/linux-modules-connected-to-turla-apt-discovered/109765/ >
2015	Operation “Satellite Turla” Obviously, such incredibly apparent and large-scale attacks have little chance of surviving for long periods of time, which is one of the key requirements for running an APT operation. It is therefore not very feasible to perform the attack through MitM traffic hijacking, unless the attackers have direct control over some high-traffic network points, such as backbone routers or fiber optics. There are signs that such attacks are becoming more common, but there is a much simpler way to hijack satellite-based Internet traffic. < https://securelist.com/satellite-turla-apt-command-and-control-in-the-sky/72081/ >
2015	Operation “WITCHCOVEN” When an unsuspecting user visits any of the over 100 compromised websites, a small piece of inserted code—embedded in the site’s HTML and invisible to casual visitors—quietly redirects the user’s browser to a second compromised website without the user’s knowledge. This second website hosts the WITCHCOVEN script, which uses profiling techniques to collect technical information on the

		<p>user's computer. As of early November 2015, we identified a total of 14 websites hosting the WITCHCOVEN profiling script. <https://www2.fireeye.com/rs/848-DID-242/images/rpt-witchcoven.pdf></p>
Nov 2016	Operation "Skipper Turla"	<p>On 28 January 2017, John Lambert of Microsoft (@JohnLaTwC) tweeted about a malicious document that dropped a "very interesting .JS backdoor". Since the end of November 2016, Kaspersky Lab has observed Turla using this new JavaScript payload and specific macro variant.</p> <p>(<https://securelist.com/kopiluwak-a-new-javascript-payload-from-turla/77429/>)</p> <p>(<https://securelist.com/introducing-whitebear/81638/>)</p>
2017	Operation "Turla Mosquito"	<p>ESET researchers have observed a significant change in the campaign of the infamous espionage group</p> <p>(<https://www.welivesecurity.com/2018/05/22/turla-mosquito-shift-towards-generic-tools/>)</p>
Mar 2017	New versions of Carbon	<p>The Turla espionage group has been targeting various institutions for many years. Recently, we found several new versions of Carbon, a second stage backdoor in the Turla group arsenal.</p> <p>(<https://www.welivesecurity.com/2017/03/30/carbon-paper-peering-turlas-second-stage-backdoor/>)</p>
May 2017	New backdoor Kazuar	<p>(<https://unit42.paloaltonetworks.com/unit42-kazuar-multiplatform-espionage-backdoor-api-access/>)</p>
Jun 2017	Some of the tactics used in APT attacks die hard.	<p>A good example is provided by Turla's watering hole campaigns. Turla, which has been targeting governments, government officials and diplomats for years – see, as an example, this recent paper – is still using watering hole techniques to redirect potentially interesting victims to their C&C infrastructure. In fact, they have been using them since at least 2014 with very few variations in their modus operandi.</p> <p>(<https://www.welivesecurity.com/2017/06/06/turlas-watering-hole-campaign-updated-firefox-extension-abusing-instagram/>)</p>
Jul 2017	Russian malware link hid in a comment on Britney Spears' Instagram	<p>The Slovak IT security company ESET Security released a report yesterday detailing a cleverly hidden example of such a post. And its hideout? A Britney Spears photo. Among the nearly 7,000 comments written on the performer's post (shown below) was one that could easily pass as spam.</p> <p>(<https://www.engadget.com/2017/06/07/russian-malware-hidden-britney-spears-instagram/>)</p>
Aug 2017	New backdoor Gazer	<p><https://www.welivesecurity.com/wp-content/uploads/2017/08/eset-gazer.pdf></p>
Aug 2017	In this case, the dropper is being delivered with a benign and possibly stolen decoy document inviting recipients to a G20 task force meeting	

		on the “Digital Economy”. The Digital Economy event is actually scheduled for October of this year in Hamburg, Germany. <https://www.proofpoint.com/us/threat-insight/post/turla-apt-actor-refreshes-kopiluwak-javascript-backdoor-use-g20-themed-attack>
	Jan 2018	A notorious hacking group is targeting the UK with an updated version of malware designed to embed itself into compromised networks and stealthily conduct espionage. Both the Neuron and Nautilus malware variants have previously been attributed to the Turla advanced persistent threat group, which regularly carries out cyber-espionage against a range of targets, including government, military, technology, energy, and other commercial organisations. <https://www.zdnet.com/article/this-hacking-gang-just-updated-the-malware-it-uses-against-uk-targets/>
	Jan 2018	Espionage Group Rolls Out Brand-New Toolset in Attacks Against Governments Waterbug may have hijacked a separate espionage group’s infrastructure during one attack against a Middle Eastern target. <https://www.symantec.com/blogs/threat-intelligence/waterbug-espionage-governments>
	Mar 2018	Starting in March 2018, we observed a significant change in the campaign: it now leverages the open source exploitation framework Metasploit before dropping the custom Mosquito backdoor. <https://www.welivesecurity.com/2018/05/22/turla-mosquito-shift-towards-generic-tools/>
	2018	Much of our 2018 research focused on Turla’s KopiLuwak javascript backdoor, new variants of the Carbon framework and meterpreter delivery techniques. Also interesting was Mosquito’s changing delivery techniques, customized PoshSec-Mod open-source powershell use, and borrowed injector code. We tied some of this activity together with infrastructure and data points from WhiteBear and Mosquito infrastructure and activity in 2017 and 2018. <https://securelist.com/shedding-skin-turlas-fresh-faces/88069/>
	Early 2019	2019 has seen the Turla actor actively renew its arsenal. Its developers are still using a familiar coding style, but they’re creating new tools. Here we’ll tell you about several of them, namely “Topinambour” (aka Sunchoke – the Jerusalem artichoke) and its related modules. We didn’t choose to name it after a vegetable; the .NET malware developers named it Topinambour themselves. <https://securelist.com/turla-renews-its-arsenal-with-topinambour/91687/>
	Apr 2019	COMfun successor Reductor infects files on the fly to compromise TLS traffic <https://securelist.com/comfun-successor-reductor/93633/>
	May 2019	Turla, also known as Snake, is an infamous espionage group recognized for its complex malware. To confound detection, its operators recently started using PowerShell scripts that provide direct, in-memory loading and execution of malware executables and libraries. This allows them to bypass detection that can trigger when a malicious executable is dropped on disk.

		https://www.welivesecurity.com/2019/05/29/turla-powershell-usage/
2019	Turla accessed and used the Command and Control (C2) infrastructure of Iranian APTs to deploy their own tools to victims of interest. Turla directly accessed 'Poison Frog' C2 panels from their own infrastructure and used this access to task victims to download additional tools. https://www.ncsc.gov.uk/news/turla-group-exploits-iran-apt-to-expand-coverage-of-victims	
Sep 2019	ESET researchers found a watering hole (aka strategic web compromise) operation targeting several high-profile Armenian websites. It relies on a fake Adobe Flash update lure and delivers two previously undocumented pieces of malware we have dubbed NetFlash and PyFlash. https://www.welivesecurity.com/2020/03/12/tracking-turla-new-backdoor-armenian-watering-holes/	
Nov 2019	COMfun authors spoof visa application with HTTP status-based Trojan https://securelist.com/comfun-http-status-based-trojan/96874/	
Jan 2020	During our investigation, we were able to identify three different targets where ComRAT v4 has been used: <ul style="list-style-type: none">• Two Ministries of Foreign Affairs in Eastern Europe• One national parliament in the Caucasus region https://www.welivesecurity.com/wp-content/uploads/2020/05/ESET_Turla_ComRAT.pdf

MITRE ATT&CK	https://attack.mitre.org/groups/G0010/	

Urpage

Names	Urpage (<i>Trend Micro</i>)
Country	[Middle East]
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2018
Description	(Trend Micro) In the process of monitoring changes in the threat landscape, we get a clearer insight into the way threat actors work behind the schemes. In this case we dig deeper into the possible connection between cyberattacks by focusing on the similarities an unnamed threat actor shares with Patchwork , Dropping Elephant , and another threat actor called Bahamut . For the sake of this report, we will call this unnamed threat actor “Urpage.”
Observed	Countries: Pakistan.
Tools used	Trojaned Android applications.
Information	< https://blog.trendmicro.com/trendlabs-security-intelligence/the-urpage-connection-to-bahamut-confucius-and-patchwork/ >

Vendetta

Names	Vendetta (<i>Qihoo 360</i>)
Country	Turkey
Motivation	Information theft and espionage
First seen	2020
Description	(<i>Qihoo 360</i>) Starting in April this year, 360 Baize Lab intercepted a large number of attack samples from an unknown hacker organization. The hacker organization sent a phishing email to the victim by forging a police station investigation letter, COVID-19 detection notice, etc. Through the backdoor virus to control the victim's machine, steal valuable sensitive data related to the target.
Observed	Countries: Australia, Austria, China, Egypt, Mexico, Romania, Russia and USA.
Tools used	NanoCore RAT, RemcosRAT, ReZer0 and RoboSki.
Information	< https://blog.360totalsecurity.com/en/vendetta-new-threat-actor-from-europe/ >

Vicious Panda

Names	Vicious Panda (<i>Check Point</i>)	
Country	China	
Motivation	Information theft and espionage	
First seen	2015	
Description	<p>(<i>Check Point</i>) Check Point Research discovered a new campaign against the Mongolian public sector, which takes advantage of the current Coronavirus scare, in order to deliver a previously unknown malware implant to the target.</p> <p>A closer look at this campaign allowed us to tie it to other operations which were carried out by the same anonymous group, dating back to at least 2016. Over the years, these operations targeted different sectors in multiple countries, such as Ukraine, Russia, and Belarus.</p>	
Observed	<p>Sectors: Government. Countries: Belarus, Mongolia, Russia and Ukraine.</p>	
Tools used	8.t Dropper, BBSRAT, Byeby, Cmstar, Enfal and Pylot.	
Operations performed	Aug 2015	Digital Quartermaster Scenario Demonstrated in Attacks Against the Mongolian Government https://unit42.paloaltonetworks.com/digital-quartermaster-scenario-demonstrated-in-attacks-against-the-mongolian-government/
	Jun 2017	Threat Actors Target Government of Belarus Using CMSTAR Trojan https://unit42.paloaltonetworks.com/unit42-threat-actors-target-government-belarus-using-cmstar-trojan/
	Mar 2020	Vicious Panda: The COVID Campaign Check Point Research discovered a new campaign against the Mongolian public sector, which takes advantage of the current Coronavirus scare, in order to deliver a previously unknown malware implant to the target. https://research.checkpoint.com/2020/vicious-panda-the-covid-campaign/
Information	https://research.checkpoint.com/2020/vicious-panda-the-covid-campaign/	

Volatile Cedar

Names	Volatile Cedar (<i>Check Point</i>) Dancing Salome (<i>Kaspersky</i>)	
Country	Lebanon	
Motivation	Information theft and espionage	
First seen	2012	
Description	<p>(Check Point) Beginning in late 2012, the carefully orchestrated attack campaign we call Volatile Cedar has been targeting individuals, companies and institutions worldwide. This campaign, led by a persistent attacker group, has successfully penetrated a large number of targets using various attack techniques, and specifically, a custom-made malware implant codenamed Explosive. This report provides an extended technical analysis of Volatile Cedar and the Explosive malware.</p> <p>We have seen clear evidence that Volatile Cedar has been active for almost 3 years. While many of the technical aspects of the threat are not considered “cutting edge”, the campaign has been continually and successfully operational throughout this entire timeline, evading detection by the majority of AV products. This success is due to a well-planned and carefully managed operation that constantly monitors its victims’ actions and rapidly responds to detection incidents.</p>	
Observed	Sectors: Education, Government and Hosting. Countries: Canada, Israel, Lebanon, Russia, Saudi Arabia, UK and USA.	
Tools used	Explosive.	
Operations performed	Jun 2015	After going public with our findings, we were provided with a new configuration belonging to a newly discovered sample we have never seen before. https://blog.checkpoint.com/2015/06/09/new-data-volatile-cedar/
Information	https://www.checkpoint.com/downloads/volatile-cedar-technical-report.pdf https://securelist.com/sinkholing-volatile-cedar-dga-infrastructure/69421/	

Wassonite

Names	Wassonite (<i>Dragos</i>)
Country	North Korea
Motivation	Information theft and espionage
First seen	2018
Description	<p>(Dragos) Dragos identified the WASSONITE activity group following a malware intrusion at the Kudankulam Nuclear Power Plant (KKNPP) nuclear facility in India. After further investigation, Dragos observed WASSONITE tools and behaviors targeting multiple industrial control system (ICS) entities including electric generation, nuclear energy, manufacturing, and organizations involved in space-centric research. WASSONITE has been active since at least 2018.</p> <p>WASSONITE targeting focuses on Asian entities, largely in India, as well as possibly Japan and South Korea. At this time, WASSONITE does not appear to have an ICS-specific disruptive or destructive capability. All the activity represents Stage 1 ICS kill-chain: access operations within IT networks.</p> <p>WASSONITE operations rely on deploying DTrack malware for remote access to victim machines, capturing credentials via Mimikatz and publicly available tools, and utilizing system tools to transfer files and move laterally within the enterprise system. Researchers first disclosed DTrack in late September 2019, and identified the tool targeting Indian financial institutions and research centers. DTrack is loosely connected to an earlier observed malware family, ATMDTrack, used for robbing ATM machines.</p> <p>Third-party security firms associate DTrack and its related malware to the Lazarus Group, Hidden Cobra, Labyrinth Chollima. Dragos also associates the activity group Covellite to Lazarus Group. However, while COVELLITE is also linked to broader Lazarus activity, this group leveraged substantially different capabilities and infrastructure to pursue a target set that does not overlap with observed WASSONITE activity.</p>
Observed	Sectors: Energy, Oil and gas, Manufacturing and Research. Countries: India, Japan and South Korea.
Tools used	Dtrack and Mimikatz.
Operations performed	Oct 2019 Breach of the Kudankulam Nuclear Power Plant https://www.zdnet.com/article/confirmed-north-korean-malware-found-on-indian-nuclear-plants-network/
Information	< https://dragos.com/resource/wassonite/ >

The White Company

Names	The White Company (<i>Cylance</i>)	
Country	[Unknown]	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2017	
Description	(Cylance) Cylance has determined that Operation Shaheen was an espionage campaign executed over the course of the last year. It was a targeted campaign which appeared to focus on individuals and organizations in Pakistan, specifically the government and the military. Cylance's window into this campaign, though significant, is not all-encompassing. Indeed, our research revealed evidence that The White Company conducted extensive prior reconnaissance of its targets, and continues to operate largely unnoticed by the security community.	
Observed	Sectors: Defense and Government. Countries: Pakistan.	
Tools used		
Operations performed	Nov 2017	Operation "Shaheen" We have dubbed the first campaign Operation Shaheen. It examines a complex espionage effort directed at the Pakistani military.
Information	< https://www.cylance.com/content/dam/cylance-web/en-us/resources/knowledge-center/resource-library/reports/WhiteCompanyOperationShaheenReport.pdf >	
MITRE ATT&CK	< https://attack.mitre.org/groups/G0089/ >	

Whitefly, Mofang

Names	Whitefly (<i>Symantec</i>) Mofang (<i>Fox-IT</i>) TEMP.Mimic (<i>FireEye</i>) ATK 83 (<i>Thales</i>) SectorM04 (<i>ThreatRecon</i>) Superman
Country	China
Motivation	Information theft and espionage
First seen	2012
Description	(<i>Fox-IT</i>) Mofang is a threat actor that almost certainly operates out of China and is probably government-affiliated. It is highly likely that Mofang's targets are selected based on involvement with investments, or technological advances that could be perceived as a threat to the Chinese sphere of influence. This is most clearly the case in a campaign focusing on government and critical infrastructure of Myanmar that is described in this report. Chances are about even, though, that Mofang is a relevant threat actor to any organization that invests in Myanmar or is otherwise politically involved. In addition to the campaign in Myanmar, Mofang has been observed to attack targets across multiple sectors (government, military, critical infrastructure and the automotive and weapon industries) in multiple countries.
Observed	Sectors: Automotive, Critical infrastructure, Defense, Engineering, Government, Healthcare, Media, Telecommunications and weapon industries. Countries: Canada, Germany, India, Myanmar, Singapore, South Korea and USA.
Tools used	Mimikatz, Nibatad, ShimRAT, Termite, Vcrodat and Living off the Land.
Operations performed	Jul 2018 Breach of SingHealth <https://www.reuters.com/article/us-singapore-cyberattack/cyberattack-on-singapore-health-database-steals-details-of-1-5-million-including-pm-idUSKBN1KA14J> <https://redalert.nshc.net/2019/03/19/sectorM04-targeting-singapore-custom-malware-analysis/>
Information	< https://foxitsecurity.files.wordpress.com/2016/06/fox-it_mofang_threatreport_tlp-white.pdf > < https://www.symantec.com/blogs/threat-intelligence/whitefly-espionage-singapore >

Wicked Spider, APT 22

Names	Wicked Spider (<i>CrowdStrike</i>) APT 22 (<i>Mandiant</i>)
Country	China
Motivation	Financial crime
First seen	2018
Description	<p>(<i>CrowdStrike</i>) Winnti Group, Blackfly, Wicked Panda refers to the targeted intrusion operations of the actor publicly known as “Winnti,” whereas Wicked Spider represents this group’s financially-motivated criminal activity. Originally, Wicked Spider was observed exploiting a number of gaming companies and stealing code-signing certificates for use in other operations associated with the malware known as Winnti. Now, Winnti is commonly associated with the interests of the government of the People’s Republic of China (PRC).</p> <p>Wicked Spider has been observed targeting technology companies in Germany, Indonesia, the Russian Federation, South Korea, Sweden, Thailand, Turkey, the United States, and elsewhere. Notably, Wicked Spider has often targeted gaming companies for their certificates, which can be used in future PRC-based operations to sign malware. Ongoing analysis is still evaluating how these certificates are used — whether Wicked Spider hands the certificates off to other adversaries for use in future campaigns or stockpiles them for its own use.</p>
Observed	Sectors: Technology. Countries: Germany, Indonesia, Russia, South Korea, Sweden, Thailand, Turkey, USA and elsewhere.
Tools used	DoublePulsar, EternalBlue, Gh0st RAT and PlugX.
Information	< https://www.crowdstrike.com/blog/meet-crowdstrikes-adversary-of-the-month-for-july-wicked-spider/ >

Wild Neutron, Butterfly, Sphinx Moth

Names	Wild Neutron (<i>Kaspersky</i>) Butterfly (<i>Symantec</i>) Morpho (<i>Symantec</i>) Sphinx Moth (<i>Kudesliski</i>) The Postal Group (<i>CERT Polska</i>)	
Country	[Unknown]	
Motivation	Information theft and espionage	
First seen	2013	
Description	<p>(Symantec) A corporate espionage group has compromised a string of major corporations over the past three years in order to steal confidential information and intellectual property. The gang, which Symantec calls Butterfly, is not-state sponsored, rather financially motivated. It has attacked multi-billion dollar companies operating in the internet, IT software, pharmaceutical, and commodities sectors. Twitter, Facebook, Apple, and Microsoft are among the companies who have publicly acknowledged attacks.</p> <p>Butterfly is technically proficient and well resourced. The group has developed a suite of custom malware tools capable of attacking both Windows and Apple computers, and appears to have used at least one zero-day vulnerability in its attacks. It keeps a low profile and maintains good operational security. After successfully compromising a target organization, it cleans up after itself before moving on to its next target.</p> <p>This group operates at a much higher level than the average cybercrime gang. It is not interested in stealing credit card details or customer databases and is instead focused on high-level corporate information. Butterfly may be selling this information to the highest bidder or may be operating as hackers for hire. Stolen information could also be used for insider-trading purposes.</p>	
Observed	<p>Sectors: Bitcoin-related companies, Financial, Healthcare, Investment companies, IT, Real estate, lawyers and individual users.</p> <p>Countries: Algeria, Australia, Austria, Canada, France, Germany, Kazakhstan, Palestine, Poland, Russia, Slovenia, Spain, Switzerland, UAE, UK and USA.</p>	
Tools used	HesperBot, JripBot and many 0-days vulnerabilities.	
Operations performed	Jan 2013	Attack on Twitter <https://blog.twitter.com/official/en_us/a/2013/keeping-our-users-secure.html>
	Feb 2013	Attack on Facebook <https://www.facebook.com/notes/facebook-security/protecting-people-on-facebook/10151249208250766>

WildPressure

Names	WildPressure (Kaspersky)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2019
Description	(Kaspersky) In August 2019, Kaspersky discovered a malicious campaign distributing a fully fledged C++ Trojan that we call Milum. All the victims we registered were organizations from the Middle East. At least some of them are related to industrial sector. Our Kaspersky Threat Attribution Engine (KTAE) doesn't show any code similarities with known campaigns. Nor have we seen any target intersections. In fact, we found just three almost unique samples, all in one country. So we consider the attacks to be targeted and have currently named this operation WildPressure.
Observed	Sectors: Industrial. Countries: Middle East.
Tools used	Milum.
Information	< https://securelist.com/wildpressure-targets-industrial-in-the-middle-east/96360/ >

Winnti Group, Blackfly, Wicked Panda

Names	Winnti Group (<i>Kaspersky</i>) Blackfly (<i>Symantec</i>) Wicked Panda (<i>CrowdStrike</i>)	
Country	China	
Sponsor	State-sponsored	
Motivation	Information theft and espionage	
First seen	2010	
Description	<p>Winnti Group is a threat group with Chinese origins that has been active since at least 2010. The group has heavily targeted the gaming industry, but it has also expanded the scope of its targeting. Some reporting suggests a number of other groups, including APT 41, Axiom, Group 72, APT 17, Deputy Dog, Elderwood, Sneaky Panda, and Ke3chang, Vixen Panda, APT 15, GREF, Playful Dragon, are closely linked to or overlap with Winnti Group.</p> <p>(<i>Trend Micro</i>) The group behind the Winnti malware (which we will call the Winnti group for brevity) sprung up as a band of traditional cyber crooks, comprising black hats whose technical skills were employed to perpetrate financial fraud. Based on the use of domain names they registered, the group started out in the business of fake/rogue anti-virus products in 2007. In 2009, the Winnti group shifted to targeting gaming companies in South Korea using a self-named data- and file-stealing malware.</p> <p>The group, which was primarily motivated by profit, is noted for utilizing self-developed technically-proficient tools for their attacks. They once attacked a game server to illicitly farm in-game currency ("gaming gold", which also has real-world value) and stole source codes of online game projects. The group also engaged in the theft of digital certificates which they then used to sign their malware to make them stealthier. The Winnti group diversified its targets to include enterprises such as those in pharmaceuticals and telecommunications. The group has since earned infamy for being involved in malicious activities associated with targeted attacks, such as deploying spear-phishing campaigns and building a backdoor.</p>	
Observed	<p>Sectors: Online video game companies, Pharmaceutical and Telecommunications.</p> <p>Countries: Belarus, Brazil, China, Germany, India, Indonesia, Japan, Peru, Philippines, Russia, South Korea, Taiwan, Thailand, USA and Vietnam.</p>	
Tools used	Cobalt Strike and Winnti.	
Operations performed	2010	HBGary investigated an information security incident at an American video game company.
	2011	In the autumn of 2011, a Trojan was detected on a huge number of computers – all of them linked by the fact that they were used by players of a popular online game. It emerged that the piece of malware landed on users' computers as part of a regular update from the game's official update server. Some even suspected that the publisher itself was spying on players. However, it later became clear that the malicious program ended up on the users' computers by mistake: the cybercriminals were in fact targeting the companies that develop and release computer games. https://securelist.com/winnti-more-than-just-a-game/37029/

	2011	For example, by 2011, one of their victims was Gameforge, a company that offers so-called freemium games: while playing the games is free, it is possible to buy virtual items/money with real money. The Winnti hackers were able to directly access Gameforge's databases and modify accounts to become 'virtually' richer. <https://media.cert.europa.eu/static/MEMO/2019/TLP-WHITE-CERT-EU-MEMO-190725-1.pdf>
	Summer 2014	The Winnti hackers broke into Henkel's network in 2014. We have three files showing that this happened. <https://web.br.de/interaktiv/winnti/english/>
	Aug 2014	This time the operators put such tag in the configuration and it turned out to be the name of the well-known global pharmaceutical company headquartered in Europe. <https://securelist.com/games-are-over/70991/>
	2015	The hackers behind Winnti have also set their sights on Japan's biggest chemical company, Shin-Etsu Chemical. We have in our hands several varieties of the 2015 malware which was most likely used for the attack. <https://web.br.de/interaktiv/winnti/english/>
	Jul 2015	A BASF spokeswoman tells us in an email that in July 2015, hackers had successfully overcome "the first levels" of defense. <https://web.br.de/interaktiv/winnti/english/>
	Oct 2015	Breach of a Vietnamese gaming company <https://blog.vsec.com.vn/apt/initial-winnti-analysis-against-vietnam-game-company.html> During the investigation, a Linux version of Winnti was found. <https://medium.com/chronicle-blog/winnti-more-than-just-windows-and-gates-e4f03436031a>
	Feb 2016	Breach of German Steelmaker ThyssenKrupp <https://www.dw.com/en/thyssenkrupp-victim-of-cyber-attack/a-36695341>
	Jun 2016	According to Siemens, they were penetrated by the hackers in June 2016. <https://web.br.de/interaktiv/winnti/english/>
	Summer 2016	In the case of another Japanese company, Sumitomo Electric, Winnti apparently penetrated their networks during the summer of 2016. <https://web.br.de/interaktiv/winnti/english/>
	Mar 2017	Recently, the Winnti group, a threat actor with a past of traditional cybercrime –particularly with financial fraud, has been seen abusing GitHub by turning it into a conduit for the command and control (C&C) communications of their seemingly new backdoor (detected by Trend Micro as BKDR64_WINNTI.ONM). <https://blog.trendmicro.com/trendlabs-security-intelligence/winnti-abuses-github/>
	Apr 2018	Breach of German chemicals giant Bayer <https://www.dw.com/en/bayer-points-finger-at-wicked-panda-in-cyberattack/a-48196004>

	Nov 2018	Breach of Swiss drug maker Roche < https://www.reuters.com/article/us-germany-cyber/bASF-siemens-henkel-roche-target-of-cyber-attacks-idUSKCN1UJ147 >
	Early 2019	Covestro is regarded as Germany's most successful spin-off in the recent past. Up until June 2019, they had at least two systems on which the Winnti malware had been installed. < https://web.br.de/interaktiv/winnti/english/ >
	Early 2019	Another manufacturer of adhesives, Bostik of France, was infected with Winnti in early 2019. < https://web.br.de/interaktiv/winnti/english/ >
	2019	Lion Air, Marriott and Valve declined to comment or were not immediately available for comment < https://www.reuters.com/article/us-germany-cyber/bASF-siemens-henkel-roche-target-of-cyber-attacks-idUSKCN1UJ147 >
	Late 2019	Breach of German chemicals company Lanxess < https://www.tagesschau.de/investigativ/ndr/hackerangriff-chemieunternehmen-101.html >
	Feb 2020	Based on previous knowledge and targeting of the Winnti Group, we assess that this sample was likely used to target Gravity Co., Ltd., a South Korean video game company. The company is known for its Massive Multiplayer Online Role Playing Game (MMORPG) Ragnarok Online, which is also offered as a mobile application. < https://quointelligence.eu/2020/04/winnti-group-insights-from-the-past/ >

WindShift

Names	WindShift (<i>DarkMatter</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2018
Description	(Palo Alto) In August of 2018, DarkMatter released a report entitled “In the Trails of WindShift APT”, which unveiled a threat actor with TTPs very similar to those of Bahamut . Subsequently, two additional articles were released by Objective-See which provide an analysis of some validated WindShift samples targeting OSX systems. Pivoting on specific file attributes and infrastructure indicators, Unit 42 was able to identify and correlate additional attacker activity and can now provide specific details on a targeted WindShift attack as it unfolded at a Middle Eastern government agency.
Observed	Sectors: Government. Countries: Middle East.
Tools used	WindTail.

WIRTE Group

Names	WIRTE Group (<i>LAB52</i>)
Country	[Middle East]
Motivation	Information theft and espionage
First seen	2018
Description	<p>(LAB52) The DFIR (Digital Forensics and Incident Response) team of S2 Grupo first identified this actor in August 2018 and since then the follow-up has been carried out during the last few months.</p> <p>This group attacks the Middle East and does not use very sophisticated mechanisms, at least in the campaign started in August 2018 which was monitored. It is considered unsophisticated by the fact that the scripts are unobtrusive, communications go unencrypted by HTTP, they use Powershell (increasingly monitored), and so on. Despite this apparently unsophisticated modus operandi compared to other actors, they manage to infect their victims and carry out their objectives. In addition, as will be seen during the report, the detection rate of some of the scripts in December 2018 by the main antivirus manufacturers is low, an aspect that must be highlighted. We must be aware that once these scripts are executed, it is when the behavior analysis of many solutions will detect them, but this fact has not been studied by LAB52.</p> <p>This actor in all the artifacts analyzed shows his victims a decoy document in Arabic with different themes.</p>
Observed	Sectors: Defense, Government and diplomats. Countries: Middle East.
Tools used	EmpireProject, H-Worm and several VBScript, PowerShell and VBA scripts.
Information	< https://lab52.io/blog/wirte-group-attacking-the-middle-east/ > < https://blog.talosintelligence.com/2018/02/targeted-attacks-in-middle-east.html >
MITRE ATT&CK	< https://attack.mitre.org/groups/G0090/ >

xHunt

Names	xHunt (<i>Palo Alto</i>) SectorD01 (<i>ThreatRecon</i>)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2018
Description	<p>(<i>Palo Alto</i>) Between May and June 2019, Unit 42 observed previously unknown tools used in the targeting of transportation and shipping organizations based in Kuwait.</p> <p>The first known attack in this campaign targeted a Kuwait transportation and shipping company in which the actors installed a backdoor tool named Hisoka. Several custom tools were later downloaded to the system in order to carry out post-exploitation activities. All of these tools appear to have been created by the same developer. We were able to collect several variations of these tools including one dating back to July 2018.</p> <p>The developer of the collected tools used character names from the anime series Hunter x Hunter, which is the basis for the campaign name “xHunt.” The names of the tools collected include backdoor tools Sakabota, Hisoka, Netero and Killua. These tools not only use HTTP for their command and control (C2) channels, but certain variants of these tools use DNS tunneling or emails to communicate with their C2 as well. While DNS tunneling as a C2 channel is fairly common, the specific method in which this group used email to facilitate C2 communications has not been observed by Unit 42 in quite some time. This method uses Exchange Web Services (EWS) and stolen credentials to create email “drafts” to communicate between the actor and the tool. In addition to the aforementioned backdoor tools, we also observed tools referred to as Gon and EYE, which provide the backdoor access and the ability to carry out post-exploitation activities.</p>
Observed	Sectors: Shipping and Logistics. Countries: Kuwait.
Tools used	Gon, EYE, Hisoka, Killua, Netero and Sakabota.

ZooPark

Names	ZooPark (Kaspersky) APT-C-38 (Qihoo 360) ATK 112 (Thales)
Country	[Unknown]
Motivation	Information theft and espionage
First seen	2015
Description	<p>(Kaspersky) ZooPark is a cyberespionage operation that has been focusing on Middle Eastern targets since at least June 2015. The threat actors behind ZooPark infect Android devices using several generations of malware we label from v1-v4, with v4 being the most recent version deployed in 2017.</p> <p>The preferred infection vector for ZooPark is waterhole attacks. We found several news websites that have been hacked by the attackers to redirect visitors to a downloading site that serves malicious APKs. Some of the themes observed in campaign include "Kurdistan referendum", "TelegramGroups" and "Alnaharegypt news", among others.</p> <p>Target profile has evolved during the last years of campaign, focusing on victims in Egypt, Jordan, Morocco, Lebanon and Iran.</p>
Observed	Sectors: Media, United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA) in Amman, Jordan. Countries: Egypt, Iran, Iraq, Jordan, Kurdistan, Kuwait, Lebanon and Morocco.
Tools used	ZooPark.

[Unnamed group]

Names	[Unnamed group]
Country	Iran
Sponsor	State-sponsored
Motivation	Information theft and espionage
First seen	2019
Description	<p>(ClearSky) Over the last few weeks, several significant leaks regarding a number of Iranian APTs took place. After analyzing and investigating the documents we conclude that they are authentic. Consequently, this causes considerable harm to the groups and their operation. The identity of the actor behind the leak is currently unknown, however based on the scope and the quality of the exposed documents and information, it appears that they are professional and highly capable. This leak will likely hamstring the groups' operation in the near future. Accordingly, in our assessment this will minimize the risk of potential attacks in the next few months and possibly even year. Note –most of the leaks are posted on Telegram channels that were created specifically for this purpose.</p> <p>Below are the three main Telegram groups on which the leaks were posted:</p> <ul style="list-style-type: none">• Lab Dookhtegam pseudonym ("The people whose lips are stitched and sealed" –translation from Persian) –In this channel attack tools attributed to the group 'OilRig' were leaked; including a webshell that was inserted into the Technion, various tools that were used for DNS attacks, and more.• Green Leakers–In this channel attack tools attributed to the group 'MuddyWatter' were leaked. The group's name and its symbol are identified with the "green movement", which led the protests in Iran after the Presidential elections in 2009. These protests were heavily repressed by the revolutionary guards (IRGC)• Black Box–Unlike the previous two channels this has been around for a long time. On Friday May 5th, dozens of confidential documents labeled as "secret" (a high confidentiality level in Iran, one before the highest –top secret) were posted on this channel. The documents were related to Iranian attack groups' activity.
Observed	Sectors: Aviation, Government, IT and Telecommunications. Some Other Prolific Criminal Groups

Achilles

Names	Achilles (<i>AdvIntel</i>)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2018	
Description	<p>This actor may be related to Iridium.</p> <p>(AdvIntel) "Achilles" is an English-speaking threat actor primarily operating on various English-language underground hacking forums as well as through secure messengers. Achilles specializes in obtaining accesses to high-value corporate internal networks.</p> <p>On May 4, 2019, Achilles claimed to have access to UNICEF network as well as networks of several high-profile corporate entities. They were able to provide evidence of their presence within the UNICEF network and two private sector companies. It is noteworthy that they provided access to networks at a relatively low price range of \$5,000 USD to \$2,000 USD.</p> <p>The majority of Achilles offers are related to breaches into multinational corporate networks via external VPN and compromised RDPs. Targets include private companies and government organizations, primarily in the British Commonwealth. Achilles has been particularly active on forums through the last seven months, with rising spikes in activities in Fall 2018 and Spring 2019.</p>	
Observed	<p>Sectors: Defense, Government and private sectors.</p> <p>Countries: Australia, UK and USA.</p>

Andromeda Spider

Names	Andromeda Spider (<i>CrowdStrike</i>)	
Country	Belarus	
Motivation	Financial crime	
First seen	2011	
Description	<p>(Virus Bulletin) Andromeda, also known as Gamaru and Wauchos, is a modular and HTTP-based botnet that was discovered in late 2011. From that point on, it managed to survive and continue hardening by evolving in different ways. In particular, the complexity of its loader and AV evasion methods increased repeatedly, and C&C communication changed between the different versions as well.</p> <p>We deal with versions of this threat on a daily basis and we have collected a number of different variants. The botnet first came onto our tracking radar at version 2.06, and we have tracked the versions since then. In this paper we will describe the evolution of Andromeda from version 2.06 to 2.10 and demonstrate both how it has improved its loader to evade automatic analysis/detection and how the payload varies among the different versions.</p> <p>This article could also be seen as a way to say 'goodbye' to the botnet: a takedown effort, followed by the arrest of the suspected botnet owner in December 2017, may mean we have seen the last of the botnet that has plagued Internet users for more than half a decade.</p> <p>The Andromeda botnet has been observed to be used by Transparent Tribe, APT 36.</p>

Avalanche

Names	Avalanche	
Country	Russia	
Motivation	Financial crime	
First seen	2006	
Description	<p>(US-CERT) Cyber criminals utilized Avalanche botnet infrastructure to host and distribute a variety of malware variants to victims, including the targeting of over 40 major financial institutions. Victims may have had their sensitive personal information stolen (e.g., user account credentials). Victims' compromised systems may also have been used to conduct other malicious activity, such as launching denial-of-service (DoS) attacks or distributing malware variants to other victims' computers.</p> <p>In addition, Avalanche infrastructure was used to run money mule schemes where criminals recruited people to commit fraud involving transporting and laundering stolen money or merchandise.</p> <p>Avalanche used fast-flux DNS, a technique to hide the criminal servers, behind a constantly changing network of compromised systems acting as proxies.</p> <p>Avalanche has been observed to distribute GozNym (operated by Bamboo Spider, TA544) and much of the malware from TA505, Graceful Spider, Gold Evergreen.</p>

First seen	2016	
Description	<p>Zeus Panda, Panda Banker, or Panda is a variant of the original Zeus under the banking Trojan category. Its discovery was in 2016 in Brazil around the time of the Olympic Games. The majority of the code is derived from the original Zeus trojan, and maintains the coding to carry out man-in-the-browser, keystroke logging, and form grabbing attacks. ZeuS Panda launches attack campaigns with a variety of exploit kits and loaders by way of drive-by downloads and phishing emails, and also hooking internet search results to infected pages. Stealth capabilities make not only detecting but analyzing the malware difficult.</p> <p>GozNym has been observed to be distributed via the Avalanche botnet.</p> <p>Zeus Panda has been observed to be distributed by Emotet (operated by Mummy Spider, TA542), Smoke Loader (operated by Smoky Spider), Cutwail (operated by Narwhal Spider) and Kelihos (operated by Zombie Spider).</p>

Boson Spider

Names	Boson Spider (<i>CrowdStrike</i>)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2015	
Description	<p>(IBM) When it comes to discovering new malware, it is much more common for researchers to run across information stealers, ransomware and remote-access tools (RATs) than it is to encounter brand new complex codes like banking Trojans or targeted attack tools such as Duqu.</p> <p>Nonetheless, it is the lesser breeds, like information stealers and RATs, that are a lot more prolific in the wild. And while banking Trojans or targeted attacks are quite specific in what they do, information stealers are by far less discriminatory and thus end up affecting a greater number of people and organizations.</p> <p>That brings us to CoreBot, a new information stealer discovered and analyzed by IBM Security X-Force researchers, who indicate this is one malware piece to watch out for. CoreBot appears to be quite modular, which means that its structure and internal makeup were programmed in a way that allows for the easy adding of new data theft and endpoint control mechanisms.</p> <p>CoreBot was discovered while the researchers were studying the activity of malware on Trusteer-protected enterprise endpoints. The malware's compiled file was named "core" by its developer. Antivirus engines do not specify this malware's name yet and detect it under generic names such as Dynamer!ac or Eldorado. But while CoreBot may appear artless at first glance, without real-time theft capabilities, it is more interesting on the inside.</p> <p>CoreBot has been observed to be distributed by DinaBot (operated by Scully Spider, TA547).</p>	
Observed	<p>Sectors: Financial. Countries: Australia, Canada, Japan, UK, USA and Europe.</p>	
Tools used	CoreBot.	
Operations performed	Nov 2017	Spotted by researchers at Deep Instinct, a new version of CoreBot is being distributed in spam email campaigns with the intention of stealing information from customers of Canadian banking websites. Customers of TD, Des-Jardins, RBC, Scotia Bank, Banque National are all targeted by those behind the campaign, with successful execution of the malware allowing the attackers to steal the credentials of infected users as they login into these sites. https://www.zdnet.com/article/corebot-banking-trojan-malware-returns-after-two-year-break/

Boss Spider, Gold Lowell

Names	Boss Spider (<i>CrowdStrike</i>) Gold Lowell (<i>SecureWorks</i>)	
Country	Iran	
Motivation	Financial crime	
First seen	2015	
Description	<p>(<i>SecureWorks</i>) In late 2015, Secureworks Counter Threat Unit (CTU) researchers began tracking financially motivated campaigns leveraging SamSam ransomware (also known as Samas and SamsamCrypt). CTU researchers associate this activity with the Gold Lowell threat group. Gold Lowell typically scans for and exploits known vulnerabilities in Internet-facing systems to gain an initial foothold in a victim's network. The threat actors then deploy the SamSam ransomware and demand payment to decrypt the victim's files. The consistent tools and behaviors associated with SamSam intrusions since 2015 suggest that Gold Lowell is either a defined group or a collection of closely affiliated threat actors. Applying security updates in a timely manner and regularly monitoring for anomalous behaviors on Internet-facing systems are effective defenses against these tactics. Organizations should also create and test response plans for ransomware incidents and use backup solutions that are resilient to corruption or encryption attempts.</p>

Cyber fighters of Izz Ad-Din Al Qassam, Fraternal Jackal

Names	Cyber fighters of Izz Ad-Din Al Qassam (<i>self given</i>) Qassam Cyber Fighters (<i>self given</i>) QCF (<i>self given</i>) Fraternal Jackal (<i>CrowdStrike</i>)	
Country	Iran	
Sponsor	State-sponsored	
Motivation	Sabotage and destruction	
First seen	2012	
Description	<p>(MEMRI) On September 18, 2012, the Qassam Cyber Fighters (QCF) posted its first message, in both English and Arabic, on its Pastebin page; the message warned the world that it was now targeting U.S. banks for hacking attacks, and would do so in the future as well.</p> <p>Since its emergence, the group has vowed to continue to carry out cyber attacks against Western targets until YouTube removes the anti-Muslim video 'Innocence of Muslims,' stating in its first communiqué: 'All the Muslim youths who are active in the Cyber world will attack to American and Zionist bases as much as needed such that they say that they are sorry about that insult.'</p> <p>Since the September 18, 2012 message, in which it announced that it was planning to attack the Bank of America and New York Stock Exchange on that date, it has been widely speculated that the group's origins are in fact Iranian. Western media sources, as well as analysts who have studied the QCF, have stated that it is actually an Iranian front. Cyber security analyst Dancho Danchev performed the most authoritative open-source intelligence (OSINT) analysis on the issue of the group's links to Iran, aimed at exposing one of the individuals in the group, while former Senator Joseph I. Lieberman told C-Span that he believed that Iran's government was sponsoring the group's attacks on U.S. banks in retaliation for Western economic sanctions. Additionally, The New York Times quoted unnamed U.S. intelligence officials stating that the 'group is a convenient cover for Iran.'</p> <p>The QCF claims to have attacked Bank of America, the New York Stock Exchange, Capital One Financial Corp, SunTrust Banks Inc., BB&T, HSBC, JPMorgan Chase & CO, PNC Financial Services, U.S. Bancorp, Citigroup Citibank, Wells Fargo & Company, Ally Financial, Fifth Third Bancorp, Zions Bancorporation, Union Bank, Comerica, Citizens Bank, Umpqua Bank, People's United Bank, University Federal Credit Union, Patelco Credit Union, American Express, KeyCorp, Ameriprise Financial, Citizens Financial, BBVA Compass, UMB Financial Corporation, M&T Bank, Bank of the West, Regions Financial Corp, Euronext, and Synovus Financial Corporation.</p>

Fxmsp

Names	Fxmsp (<i>self given</i>) ATK 134 (<i>Thales</i>) TAG-CR17	
Country	Kazakhstan	
Motivation	Financial gain	
First seen	2016	
Description	<p>(AdvIntel) Throughout 2017 and 2018, Fxmsp established a network of trusted proxy resellers to promote their breaches on the criminal underground. Some of the known Fxmsp TTPs included accessing network environments via externally available remote desktop protocol (RDP) servers and exposed active directory.</p> <p>Most recently, the actor claimed to have developed a credential-stealing botnet capable of infecting high-profile targets in order to exfiltrate sensitive usernames and passwords. Fxmsp has claimed that developing this botnet and improving its capabilities for stealing information from secured systems is their main goal.</p>

Gnosticplayers

Names	Gnosticplayers (<i>self given</i>)		
Country	Pakistan		
Motivation	Financial gain		
First seen	2019		
Description	<p>(ZDNet) The hacker said that he put up the data for sale mainly because these companies had failed to protect passwords with strong encryption algorithms like bcrypt.</p> <p>Most of the hashed passwords the hacker put up for sale today can cracked with various levels of difficulty –but they can be cracked.</p> <p>“I got upset because I feel no one is learning,” the hacker told ZDNet in an online chat earlier today. “I just felt upset at this particular moment, because seeing this lack of security in 2019 is making me angry.”</p> <p>In a conversation with ZDNet last month, the hacker told us he wanted to hack and put up for sale more than one billion records and then retire and disappear with the money.</p> <p>But in a conversation today, the hacker says this is not his target anymore, as he learned that other hackers have already achieved the same goal before him.</p> <p>Gnosticplayers also revealed that not all the data he obtained from hacked companies had been put up for sale. Some companies gave into extortion demands and paid fees so breaches would remain private.</p> <p>“I came to an agreement with some companies, but the concerned startups won’t see their data for sale,” he said. “I did it that’s why I can’t publish the rest of my databases or even name them.”</p>

Hacking Team

Names	Hacking Team (<i>real name</i>)
Country	Italy
Motivation	Financial gain
First seen	2003
Description	<p>The many 0-days that had been collected by Hacking Team and which became publicly available during the breach of their organization in 2015, have been used by several APT groups since.</p> <p>(ESET) Since being founded in 2003, the Italian spyware vendor Hacking Team gained notoriety for selling surveillance tools to governments and their agencies across the world.</p> <p>The capabilities of its flagship product, the Remote Control System (RCS), include extracting files from a targeted device, intercepting emails and instant messaging, as well as remotely activating a device's webcam and microphone. The company has been criticized for selling these capabilities to authoritarian governments – an allegation it has consistently denied.</p> <p>When the tables turned in July 2015, with Hacking Team itself suffering a damaging hack, the reported use of RCS by oppressive regimes was confirmed. With 400GB of internal data – including the once-secret list of customers, internal communications, and spyware source code – leaked online, Hacking Team was forced to request its customers to suspend all use of RCS, and was left facing an uncertain future.</p> <p>Following the hack, the security community has been keeping a close eye on the company's efforts to get back on its feet. The first reports suggesting Hacking Team's resumed operations came six months later – a new sample of Hacking Team's Mac spyware was apparently in the wild. A year after the breach, an investment by a company named Tablem Limited brought changes to Hacking Team's shareholder structure, with Tablem Limited taking 20% of Hacking Team's shareholding. Tablem Limited is officially based in Cyprus; however, recent news suggests it has ties to Saudi Arabia.</p>

Indrik Spider

Names	Indrik Spider (<i>CrowdStrike</i>) Evil Corp (<i>self given</i>)	
Country	Russia	
Motivation	Financial crime, Financial gain	
First seen	2014	
Description	<p>(<i>CrowdStrike</i>) Indrik Spider is a sophisticated eCrime group that has been operating Dridex since June 2014. In 2015 and 2016, Dridex was one of the most prolific eCrime banking Trojans on the market and, since 2014, those efforts are thought to have netted Indrik Spider millions of dollars in criminal profits. Throughout its years of operation, Dridex has received multiple updates with new modules developed and new anti-analysis features added to the malware.</p> <p>In August 2017, a new ransomware variant identified as BitPaymer was reported to have ransomed the U.K.'s National Health Service (NHS), with a high ransom demand of 53 BTC (approximately \$200,000 USD). The targeting of an organization rather than individuals, and the high ransom demands, made BitPaymer stand out from other contemporary ransomware at the time. Though the encryption and ransom functionality of BitPaymer was not technically sophisticated, the malware contained multiple anti-analysis features that overlapped with Dridex. Later technical analysis of BitPaymer indicated that it had been developed by Indrik Spider, suggesting the group had expanded its criminal operation to include ransomware as a monetization strategy.</p> <p>Indrik Spider appears to be a subgroup of TA505, Graceful Spider, Gold Evergreen. In 2019, a subgroup of Indrik Spider split off into Doppel Spider.</p> <p>Dridex has been observed to be distributed via Necurs (operated by Monty Spider) and Emotet (operated by Mummy Spider, TA542).</p>

Description	<p>(IBM) Necurs emerged in 2012 as an infector and rootkit, and quickly partnered with elite cybercrime gangs to become part of the top spamming and infection forces in the malware realm. Unlike most botnets, Necurs stands out due to its technical complexity, partnership diversity and continued evolution in an era when even the most complex malicious infrastructures can no longer withstand disruption.</p> <p>In the past year alone, we have seen Necurs take on various roles. Linked with the spam distribution of the Dridex gang, it is used to spread one of the world's most nefarious banking Trojans. It also moved to mass distributing Locky, Dridex's ransomware child, then added distributed denial-of-service (DDoS) attacks. Most recently, Necurs moved to pump-and-dump stock scam distribution before returning to spreading millions of Dridex-laden spam emails a day.</p> <p>Necurs has been observed to distribute Dridex (Indrik Spider), Locky (Dungeon Spider), TrickBot (Wizard Spider, Gold Blackburn) and much of the malware from TA505, Graceful Spider, Gold Evergreen.</p>

Mummy Spider, TA542

Names	Mummy Spider (<i>CrowdStrike</i>) TA542 (<i>Proofpoint</i>) ATK 104 (<i>Thales</i>) Mealybug (<i>Symantec</i>)	
Country	[Unknown]	
Motivation	Financial gain	
First seen	2014	
Description	<p>(Crowdstrike) Mummy Spider is a criminal entity linked to the core development of the malware most commonly known as Emotet or Geodo. First observed in mid-2014, this malware shared code with the Bugat (aka Feodo) banking Trojan. However, Mummy Spider swiftly developed the malware's capabilities to include an RSA key exchange for command and control (C2) communication and a modular architecture.</p> <p>Mummy Spider does not follow typical criminal behavioral patterns. In particular, Mummy Spider usually conducts attacks for a few months before ceasing operations for a period of between three and 12 months, before returning with a new variant or version.</p> <p>After a 10 month hiatus, Mummy Spider returned Emotet to operation in December 2016 but the latest variant is not deploying a banking Trojan module with web injects, it is currently acting as a 'loader' delivering other malware packages. The primary modules perform reconnaissance on victim machines, drop freeware tools for credential collection from web browsers and mail clients and a spam plugin for self-propagation. The malware is also issuing commands to download and execute other malware families such as the banking Trojans Dridex and Qakbot.</p> <p>Mummy Spider advertised Emotet on underground forums until 2015, at which time it became private. Therefore, it is highly likely that Emotet is operated solely for use by Mummy Spider or with a small trusted group of customers.</p> <p>Emotet has been observed to distribute BokBot (Lunar Spider), Dridex (Indrik Spider), DoppelPaymer (Doppel Spider), Zeus Panda (Bamboo Spider, TA544) and Trickbot (Wizard Spider, Gold Blackburn), as well as QakBot.</p>

Narwhal Spider

Names	Narwhal Spider (<i>CrowdStrike</i>)	
Country	[Unknown]	
Motivation	Financial gain	
First seen	2007	
Description	<p>(<i>CrowdStrike</i>) CrowdStrike Falcon Intelligence has observed a new Cutwail spam campaign from NARWHAL SPIDER on 24 October 2018. NARWHAL SPIDER is the adversary name designated by Falcon Intelligence for the criminal operator of Cutwail version 2. NARWHAL SPIDER primarily provides spam services with a large customer base that has included malware operators such as Wizard Spider, Gold Blackburn (developer of TrickBot), affiliates of BAMBOO SPIDER (developer of Panda Zeus), and many others including URLZone, Nymaim and Gozi ISFB. The targets and payloads delivered through Cutwail spam campaigns are determined by the customers of NARWHAL SPIDER.</p> <p>Cutwail has been observed to distribute Dyre (Wizard Spider, Gold Blackburn), Zeus Panda (Bamboo Spider, TA544) and much of the malware from TA505, Graceful Spider, Gold Evergreen.</p>	
Observed	Countries: Worldwide.	
Tools used	Cutwail.

Operation Windigo

Names	Operation Windigo (<i>ESET</i>)	
Country	Russia	
Motivation	Financial gain	
First seen	2011	
Description	<p>(<i>ESET</i>) This document details a large and sophisticated operation, code named "Windigo", in which a malicious group has compromised thousands of Linux and Unix servers. The compromised servers are used to steal SSH credentials, redirect web visitors to malicious content and send spam.</p> <p>This operation has been ongoing since at least 2011 and has affected high profile servers and companies, including cPanel – the company behind the famous web hosting control panel – and Linux Foundation's kernel.org – the main repository of source code for the Linux kernel. However this operation is not about stealing company resources or altering Linux's source code as we will unveil throughout the report.</p> <p>The complexity of the backdoors deployed by the malicious actors shows out of the ordinary knowledge of operating systems and programming. Additionally, extra care was given to ensure portability, meaning the various pieces of malware will run on a wide range of server operating systems and to do so in an extremely stealthy fashion.</p> <p>The Windigo operation does not leverage any new vulnerability against Linux or Unix systems. Known systemic weaknesses were exploited by the malicious actors in order to build and maintain their botnet.</p>

Pacha Group

Names	Pacha Group (Intezer)	
Country	China	
Motivation	Financial gain	
First seen	2018	
Description	<p>(Intezer) Antd is a miner found in the wild on September 18, 2018. Recently we discovered that the authors from Antd are actively delivering newer campaigns deploying a broad number of components, most of them completely undetected and operating within compromised third party Linux servers. Furthermore, we have observed that some of the techniques implemented by this group are unconventional, and there is an element of sophistication to them. We believe the authors behind this malware are from Chinese origin. We have labeled the undetected Linux.Antd variants, Linux.GreedyAntd and classified the threat actor as Pacha Group.</p>	
Observed		
Tools used	Antd, DDG, Korkerds and XMRig.	
Operations performed	Sep 2018	Intezer has evidence dating back to September 2018 which shows Pacha Group has been using a cryptomining malware that has gone undetected on other engines. https://www.intezer.com/blog-pacha-group-deploying-undetected-cryptojacking-campaigns/

Parinacota

Names	Parinacota (<i>Microsoft</i>)
Country	[Unknown]
Motivation	Financial gain
First seen	2018
Description	<p>(Microsoft) One actor that has emerged in this trend of human-operated attacks is an active, highly adaptive group that frequently drops Wadrama as payload. Microsoft has been tracking this group for some time, but now refers to them as PARINACOTA, using our new naming designation for digital crime actors based on global volcanoes.</p> <p>PARINACOTA impacts three to four organizations every week and appears quite resourceful: during the 18 months that we have been monitoring it, we have observed the group change tactics to match its needs and use compromised machines for various purposes, including cryptocurrency mining, sending spam emails, or proxying for other attacks. The group's goals and payloads have shifted over time, influenced by the type of compromised infrastructure, but in recent months, they have mostly deployed the Wadrama ransomware.</p> <p>The group most often employs a smash-and-grab method, whereby they attempt to infiltrate a machine in a network and proceed with subsequent ransom in less than an hour. There are outlier campaigns in which they attempt reconnaissance and lateral movement, typically when they land on a machine and network that allows them to quickly and easily move throughout the environment.</p>
Observed	Worldwide.
Tools used	Mimikatz, ProcDump, Wadrama.

Pinchy Spider, Gold Southfield

Names	Pinchy Spider (CrowdStrike) Gold Southfield (SecureWorks) Gold Garden (SecureWorks)	
Country	Russia	
Motivation	Financial gain	
First seen	2018	
Description	<p>(CrowdStrike) CrowdStrike Intelligence has recently observed Pinchy Spider affiliates deploying GandCrab ransomware in enterprise environments, using lateral movement techniques and tooling commonly associated with nation-state adversary groups and penetration testing teams. This change in tactics makes Pinchy Spider and its affiliates the latest eCrime adversaries to join the growing trend of targeted, low-volume/high-return ransomware deployments known as “big game hunting.”</p> <p>Pinchy Spider is the criminal group behind the development of the ransomware most commonly known as GandCrab, which has been active since January 2018. Pinchy Spider sells access to use GandCrab ransomware under a partnership program with a limited number of accounts. The program is operated with a 60-40 split in profits (60 percent to the customer), as is common among eCrime actors, but Pinchy Spider is also willing to negotiate up to a 70-30 split for “sophisticated” customers.</p> <p>GandCrab and Sodinokibi have been observed to be distributed by DanaBot (operated by Scully Spider, TA547) and Taurus Loader (operated by Venom Spider, Golden Chickens).</p>

Rocke, Iron Group

Names	Rocke (<i>Talos</i>) Iron Group (<i>Intezer</i>)	
Country	China	
Motivation	Financial gain	
First seen	2018	
Description	<p>(<i>Talos</i>) This threat actor initially came to our attention in April 2018, leveraging both Western and Chinese Git repositories to deliver malware to honeypot systems vulnerable to an Apache Struts vulnerability.</p> <p>In late July, we became aware that the same actor was engaged in another similar campaign. Through our investigation into this new campaign, we were able to uncover more details about the actor.</p>	
Observed		
Tools used	Godlua, Kerberods, LSD, Xbash and several 0-day vulnerabilities.	
Operations performed	Apr 2018	This threat actor initially came to our attention in April 2018, leveraging both Western and Chinese Git repositories to deliver malware to honeypot systems vulnerable to an Apache Struts vulnerability. <https://blog.talosintelligence.com/2018/08/rocke-champion-of-monero-miners.html>
	Dec 2018	By analyzing NetFlow data from December 2018 to June 16, 2019, we found that 28.1% of the cloud environments we surveyed had at least one fully established network connection with at least one known Rocke command-and-control (C2) domain. Several of those organizations maintained near daily connections. Meanwhile, 20% of the organizations maintained hourly heartbeats consistent with Rocke tactics, techniques, and procedures (TTPs). https://unit42.paloaltonetworks.com/rockein-the-netflow/
	Jan 2019	Palo Alto Networks Unit 42 recently captured and investigated new samples of the Linux coin mining malware used by the Rocke group. The family was suspected to be developed by the Iron cybercrime group and it's also associated with the Xbash malware we reported on in September of 2018. The threat actor Rocke was originally revealed by Talos in August of 2018 and many remarkable behaviors were disclosed in their blog post. The samples described in this report were collected in October of 2018, and since that time the command and control servers they use have been shut down. https://unit42.paloaltonetworks.com/malware-used-by-rocke-group-evolves-to-evasive-detection-by-cloud-security-products/
	May 2019	Pacha Group Competing against Rocke Group for Cryptocurrency Mining Foothold on the Cloud https://www.intezer.com/blog-technical-analysis-cryptocurrency-mining-war-on-the-cloud/
	May 2019	Over the past month we have seen new features constantly being added to the malware. For instance, in their latest major update, they have added a function that exploits systems running the software development automation server Jenkins to increase their chance of

		infecting more systems, thereby generating more profits. In addition, they have also evolved their malware by adding new attack stages, as well as new redundancies in its multi-component execution to make it more dynamic and flexible. <https://www.fortinet.com/blog/threat-research/rocke-variant-ready-to-box-mining-challengers.html>
	Summer 2019	Rocke, a China-based cryptomining threat actor, has changed its Command and Control (C2) infrastructure away from Pastebin to a self-hosted solution during the summer of 2019. <https://www.anomali.com/blog/illicit-cryptomining-threat-actor-rocke-changes-tactics-now-more-difficult-to-detect#When:14:00:00Z>

Roaming Mantis

Names	Roaming Mantis (Kaspersky) Roaming Mantis Group (Kaspersky)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2017	
Description	<p>(Kaspersky) In March 2018, Japanese media reported the hijacking of DNS settings on routers located in Japan, redirecting users to malicious IP addresses. The redirection led to the installation of Trojanized applications named facebook.apk and chrome.apk that contained Android Trojan-Banker. According to our telemetry data, this malware was detected more than 6,000 times, though the reports came from just 150 unique users (from February 9 to April 9, 2018). Of course, this is down to the nature of the malware distribution, but it also suggests a very painful experience for some users, who saw the same malware appear again and again in their network. More than half of the detections were observed targeting the Asian region.</p> <p>During our research we received some invaluable information about the true scale of this attack. There were thousands of daily connections to the command and control (C2) infrastructure, with the device locale for the majority of victims set to Korean. Since we didn't find a pre-existing name for this malware operation, we decided to assign a new one for future reference. Based on its propagation via smartphones roaming between Wi-Fi networks, potentially carrying and spreading the infection, we decided to call it 'Roaming Mantis'.</p>

Tools used	Roaming Mantis.	
Operations performed	Feb 2018	Roaming Mantis malware is designed for distribution through a simple, but very efficient trick based on a technique known as DNS hijacking. When a user attempts to access any website via a compromised router, they will be redirected to a malicious website. https://securelist.com/roaming-mantis-uses-dns-hijacking-to-infect-android-smartphones/85178/
	May 2018	In May, while monitoring Roaming Mantis, aka MoqHao and XLoader, we observed significant changes in their M.O. The group's activity expanded geographically and they broadened their attack/evasion methods. Their landing pages and malicious apk files now support 27 languages covering Europe and the Middle East. In addition, the criminals added a phishing option for iOS devices, and crypto-mining capabilities for the PC. https://securelist.com/roaming-mantis-dabbles-in-mining-and-phishing-multilingually/85607/
	Sep 2018	In addition, they have started using web crypto-mining for PC, and an Apple phishing page for iOS devices. https://securelist.com/roaming-mantis-part-3/88071/

	Feb 2019	According to our detection data, new variants of sagawa.apk Type A (Trojan-Dropper.AndroidOS.Wroba.g) have been detected in the wild, based on our KSN data from February 25, 2019 to March 20, 2019. < https://securelist.com/roaming-mantis-part-iv/90332/ >
	Jun 2019	Roaming Mantis: a new phishing method targets a Japanese MNO < https://hackmd.io/@ninoseki/Bkw66OhAN >
	Aug 2019	The McAfee mobile research team has found a new type of Android malware for the MoqHao phishing campaign (a.k.a. XLoader and Roaming Mantis) targeting Korean and Japanese users. A series of attack campaigns are still active, mainly targeting Japanese users. The new spyware has very different payloads from the existing MoqHao samples. < https://www.mcafee.com/blogs/other-blogs/mcafee-labs/moqhao-related-android-spyware-targeting-japan-and-korea-found-on-google-play/ >
	Feb 2020	The group's attack methods have improved and new targets continuously added in order to steal more funds. The attackers' focus has also shifted to techniques that avoid tracking and research: whitelist for distribution, analysis environment detection and so on. < https://securelist.com/roaming-mantis-part-v/96250/ >
	Jun 2020	The RoamingMantis Group's Expansion to European Apple Accounts and Android Devices < https://medium.com/csis-techblog/the-roamingmantis-groups-expansion-to-european-apple-accounts-and-android-devices-e6381723c681 >

Salty Spider

Names	Salty Spider (<i>CrowdStrike</i>)	
Country	Russia	
Motivation	Financial gain	
First seen	2003	
Description	<p>(CrowdStrike) The pervasiveness of Salty Spider's attacks has resulted in a long list of victims across the globe. While it seems, for the most part, that this adversary doesn't single out particular nations and industries, there do appear to be a few pockets where SALTY SPIDER may be more prevalent.</p> <p>In 2017, SALTY SPIDER ceased propagation of traditional proxy and spambot payloads, and shifted its sights towards the mining and theft of cryptocurrencies. This shift is likely an indicator that the cryptocurrency industry has proven to be a more lucrative area for monetizing Sality.</p>	
Observed	Countries: Worldwide.	
Tools used	Sality.	
Operations performed	Apr 2014	DNS hijacking is still going strong and the Win32/Sality operators have added this technique to their long-lasting botnet. This blog post describes how the malware guesses router passwords as part of its campaign to misdirect users, send spam and infect new victims. https://www.welivesecurity.com/2014/04/02/win32sality-newest-component-a-routers-primary-dns-changer-named-win32rbrute/
	Dec 2018	Sality has terrorized computer users since 2003, a year when personal digital assistants (PDAs) made tech headlines and office PCs ran Windows XP. Over the intervening years users traded their PDAs for smartphones and desktops migrated to newer operating systems and digital workplace solutions. Sality, however, survived the breakneck pace of technological innovation and continues to threaten organizations today. https://threatvector.cylance.com/en_us/home/cylance-vs-sality-malware.html

Scully Spider, TA547

Names	Scully Spider (<i>CrowdStrike</i>) TA547 (<i>Proofpoint</i>)	
Country	[Unknown]	
Motivation	Financial crime, Financial gain	
First seen	2017	
Description	<p>(<i>Proofpoint</i>) TA547 is responsible for many other campaigns since at least November 2017. The other campaigns by the actor were often localized to countries such as Australia, Germany, the United Kingdom, and Italy. Delivered malware included ZLoader (a.k.a. Terdot), Gootkit, Ursnif, Corebot, Panda Banker, Atmos, Mazar Bot, and Red Alert Android malware.</p> <p>It is worth noting that samples of DanaBot found in a public malware repository contained different campaign IDs (the “a=” parameter) than the ones we observed in the wild, suggesting that there may be activity other than that which we observed.</p> <p>Finally, we should mention that DanaBot bears some similarities in its technical implementation and choices of technology to earlier malware, in particular Reveton and CryptXXX [1], which were also written in Delphi and communicated using raw TCP to port 443. These malware strains also featured similarities in the style of C&C traffic.</p> <p>DanaBot has been observed to be distributed by Smoke Loader (operated by Smoky Spider).</p> <p>DanaBot itself has been observed to distribute CoreBot (Boson Spider), GandCrab and Sodinokibi (Pinchy Spider, Gold Southfield) and TrickBot (Wizard Spider, Gold Blackburn).</p>	
Observed	<p>Sectors: Financial. Countries: Austria, Australia, Brazil, Canada, Colombia, Germany, Hong Kong, Iraq, Italy, Poland, New Zealand, UK, Ukraine, USA and others.</p>	
Tools used	DanaBot.	
Operations performed	Sep 2018	Recently, we have spotted a surge in activity of DanaBot, a stealthy banking Trojan discovered earlier this year. The malware, first observed in campaigns targeting Australia and later Poland, has apparently expanded further, with campaigns popping up in Italy, Germany, Austria, and as of September 2018, Ukraine. https://www.welivesecurity.com/2018/09/21/danabot-targeting-europe-adds-new-features/
	Nov 2018	DanaBot appears to have outgrown the banking Trojan category. According to our research, its operators have recently been experimenting with cunning email-address-harvesting and spam-sending features, capable of misusing webmail accounts of existing victims for further malware distribution. https://www.welivesecurity.com/2018/12/06/danabot-evolves-beyond-banking-trojan-new-spam/
	Jan 2019	The fast-evolving, modular Trojan DanaBot has undergone further changes, with the latest version featuring an entirely new

		communication protocol. The protocol, introduced to DanaBot at the end of January 2019, adds several layers of encryption to DanaBot's C&C communication. https://www.welivesecurity.com/2019/02/07/danabot-updated-new-cc-communication/
	Apr 2019	DanaBot Demands a Ransom Payment https://research.checkpoint.com/2019/danabot-demands-a-ransom-payment/
	Sep 2019	Like most of the other notable banking trojans, DanaBot continues to shift tactics and evolve in order to stay relevant. F5 malware researchers first noticed these shifting tactics in September 2019, however, it is possible they began even earlier. https://www.f5.com/labs/articles/threat-intelligence/danabot-s-new-tactics-and-targets-arrive-in-time-for-peak-phishi
Information	https://www.proofpoint.com/us/threat-insight/post/danabot-new-banking-trojan-surfaces-down-under-0 https://h3collective.io/review-of-a-danabot-infection/ https://www.fortinet.com/blog/threat-research/breakdown-of-a-targeted-danabot-attack.html	

Shadow Brokers

Names	Shadow Brokers (<i>self given</i>)	
Country	USA

Smoky Spider

Names	Smoky Spider (<i>CrowdStrike</i>)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2011	
Description	<p>(IBM) According to 360 NetLab, the (relatively) ancient malware downloader has enjoyed a slow burn on the black market, where malicious actors can pick up a customized copy for \$850. While other researchers have identified various aspects of the threat, 360 NetLab took aim at the malware's admin panel, which offers support for multiple plugins and functions — such as FORM GRAB, BOT LIST, KEYLOGGER and more — designed to help attackers successfully infiltrate targeted devices.</p> <p>The flexibility of Smoke Loader remains its biggest appeal; it was among the top 10 malware threats detected by Check Point in December 2018. It's the first time a second-stage downloader has made the list, and may indicate a coming shift in the threat profiles of typical malware attacks.</p> <p>Smoke Loader has been observed to distribute DoppelPaymer (Doppel Spider), TinyLoader (Tiny Spider), DanaBot (Scully Spider, TA547), BokBot (Lunar Spider), Zeus Panda (Bamboo Spider, TA544) and TrickBot (Wizard Spider, Gold Blackburn).</p>	
Observed	Countries: Worldwide.	
Tools used	Smoke Loader and Sasfis.

Tiny Spider

Names	Tiny Spider (<i>CrowdStrike</i>)	
Country	[Unknown]	
Motivation	Financial crime	
First seen	2015	
Description	<p>(ForcePoint) It all starts with the delivery of a small loader called TinyLoader, an obfuscated executable with simple-yet powerful –downloader functionality. Upon execution, it will first brute force its own decryption key (a 32-bit value, meaning this takes a fraction of second on modern PCs) before using this to decrypt the main program code.</p> <p>The core functionality of the decrypted code is communication with a set of hardcoded C2 servers by IP and port. If the C2 is active, it will provide what is effectively a piece of shellcode, encrypted by another 32-bit constant. This shellcode is not ‘fire and forget’: it instead sees the loader establish a semi-interactive two-way communication with the C2. Note that the earliest traits and mentions of TinyLoader go back to as far as 2015.</p>	
Observed	Sectors: Retail. Countries: Worldwide.	
Tools used	PinkKite, PsExec, TinyPOS and TinyLoader.	
Operations performed	2017	A new family of point-of-sale malware, dubbed PinkKite, has been identified by researchers who say the malware is tiny in size, but can delivered a hefty blow to POS endpoints. https://threatpost.com/new-pos-malware-pinkkite-takes-flight/130428/

[Vault 7/8]

Names	[Vault 7/8]	
Country	USA	
Motivation	Financial gain	
First seen	2017	
Description	<p>An unnamed source leaked almost 10,000 documents describing a large number of 0-day vulnerabilities, methodologies and tools that had been collected by the CIA, such as, specifically, the group known as Longhorn, The Lamberts. This leaking was done through WikiLeaks, since March 2017. In weekly publications, the dumps were said to come from Vault 7 and later Vault 8, until his arrest in 2018. Most of the published vulnerabilities have since been fixed by the respective vendors, but many have been used by other threat actors.</p> <p>This actor turned out to be a former CIA software engineer.</p> <p>(WikiLeaks) Today, Tuesday 7 March 2017, WikiLeaks begins its new series of leaks on the U.S. Central Intelligence Agency. Code-named “Vault 7” by WikiLeaks, it is the largest ever publication of confidential documents on the agency.</p> <p>The first full part of the series, “Year Zero”, comprises 8,761 documents and files from an isolated, high-security network situated inside the CIA’s Center for Cyber Intelligence in Langley, Virginia. It follows an introductory disclosure last month of CIA targeting French political parties and candidates in the lead up to the 2012 presidential election.</p> <p>Recently, the CIA lost control of the majority of its hacking arsenal including malware, viruses, Trojans, weaponized “zero day” exploits, malware remote control systems and associated documentation. This extraordinary collection, which amounts to more than several hundred million lines of code, gives its possessor the entire hacking capacity of the CIA. The archive appears to have been circulated among former U.S. government hackers and contractors in an unauthorized manner, one of whom has provided WikiLeaks with portions of the archive.</p> <p>“Year Zero” introduces the scope and direction of the CIA’s global covert hacking program, its malware arsenal and dozens of “zero day” weaponized exploits against a wide range of U.S. and European company products, include Apple’s iPhone, Google’s Android and Microsoft’s Windows and even Samsung TVs, which are turned into covert microphones.</p>

Yingmob

Names	Yingmob (<i>real name</i>)	
Country	China	
Motivation	Financial gain	
First seen	2016	
Description	<p>(Check Point) Check Point Mobile Threat Prevention has detected a new, unknown mobile malware that targeted two customer Android devices belonging to employees at a large financial services institution. Mobile Threat Prevention identified the threat automatically by detecting exploitation attempts while examining the malware in the MTP emulators.</p> <p>The infection was remediated after the system notified the devices owners and the system administrators. The infection vector was a drive-by download attack, and the Check Points Threat-Cloud indicates some adult content sites served the malicious payload.</p> <p>Called HummingBad, this malware establishes a persistent rootkit with the objective to generate fraudulent ad revenue for its perpetrator, similar to the Brain Test app discovered by Check Point earlier this year. In addition, HummingBad installs fraudulent apps to increase the revenue stream for the fraudster.</p>	
Observed	Countries: Algeria, Bangladesh, Brazil, China, Colombia, Egypt, India, Indonesia, Malaysia, Mexico, Nepal, Pakistan, Philippines, Romania, Russia, Thailand, Turkey, Ukraine, USA, Vietnam and others.	
Tools used	DroidPlugin, Eomobi, HummingBad, HummingWhale and Yispecter.	
Operations performed	Jan 2017	A Whale of a Tale: HummingBad Returns https://blog.checkpoint.com/2017/01/23/hummingbad-returns/
Information	https://blog.checkpoint.com/2016/02/04/hummingbad-a-persistent-mobile-chain-attack/ http://blog.checkpoint.com/wp-content/uploads/2016/07/HummingBad-Research-report_FINAL-62916.pdf	

Zombie Spider

Names	Zombie Spider (<i>CrowdStrike</i>)	
Country	Russia	
Motivation	Financial gain	
First seen	2010	
Description	<p>(<i>CrowdStrike</i>) The primary threat actor, who was tracked by CrowdStrike as Zombie Spider, rose to prominence in the criminal underground under the moniker Peter Severa. The individual behind this handle is Peter Yuryevich LEVASHOV who was arrested in Spain when the final version of Kelihos was taken over in April 2017, and who recently pleaded guilty to operating the botnet for criminal purposes.</p> <p>For several years, pump-and-dump stock scams, dating ruses, credential phishing, money mule recruitment and rogue online pharmacy advertisements were the most common spam themes. In 2017, however, Kelihos was frequently used to spread other malware such as LuminosityLink, Zyklon HTTP, Neutrino, Nymaim, Gozi/ISFB, Panda Zeus, Kronos, and TrickBot. It was also observed spreading ransomware families including Shade, Cerber, and FileCrypt2.</p> <p>Kelihos has been observed to distribute TrickBot (Wizard Spider, Gold Blackburn) and Zeus Panda (Bamboo Spider, TA544).</p>	
Observed	Countries: Worldwide.	
Tools used	Kelihos.	
Operations performed	Feb 2017	Kelihos Spreads via USB Drives <https://www.securityweek.com/kelihos-spreads-usb-drives>
Counter operations	Mar 2012	On Wednesday, March 21, 2012, security experts from Dell SecureWorks, CrowdStrike, Kaspersky, and the Honeynet Project initiated efforts to detect and disrupt the operations of a botnet known as Waledac/Kelihos (also known as Hlux). <https://www.secureworks.com/research/waledac-kelihos-botnet-takeover>
	Apr 2017	Justice Department Announces Actions to Dismantle Kelihos Botnet <https://www.justice.gov/opa/pr/justice-department-announces-actions-dismantle-kelihos-botnet-0>
Information	(<https://www.crowdstrike.com/blog/inside-the-takedown-of-zombie-spider-and-the-kelihos-botnet/>) (<https://www.crowdstrike.com/blog/farewell-to-kelihos-and-zombie-spider/>) <https://en.wikipedia.org/wiki/Kelihos_botnet>
